## **The Graduation of the CMI 1999-2002 Mortality Experience: Final “00” Series Mortality Tables – Assured Lives**

### **Introduction**

In 2003 the Mortality Committee set up a Working Party to carry out the graduation of a new set of mortality tables, to be based on the 1999-2002 experience. The members of the Mortality Graduation Working Party (“MGWP”) are Angus Macdonald (Chairman), John Ellam, Adrian Gallop, Simon Spencer, Joanne Wells, David Wilkie and Richard Willets.

The previous work has been exposed to the Profession in a series of Working Papers:

- Working Paper 8, first published in draft form in May 2004 with the final version made available in August 2004, contained initial findings of the Working Party and proposals on which tables to graduate.
- Working Paper 12, published in April 2005, contained proposed graduations for the assured lives tables.
- Working Paper 16, published in September 2005, contained proposed graduations for the annuitant and pensioner tables.

These were widely publicised, for example via the Profession’s e-bulletins, and presentations on the draft tables have been given to numerous seminars, including ‘Current Issues in Life Assurance’ (CILA) and ‘Current Issues in Pensions’.

The MGWP would like to thank all respondents for the valuable comments made. The MGWP has considered the feedback received on both these Working Papers, and has pleasure in presenting the final “00” Series base tables of mortality. This Working Paper contains the final tables for assured lives, whilst the final tables for annuitants and pensioners are contained in Working Paper 22.

These tables have now been approved by the Faculty and Institute Management Committee (FIMC) for adoption by the Actuarial Profession with an effective date of 1 September 2006. **It is the responsibility of any actuary or other person using a base table to ensure that it is appropriate for the particular purpose to which it is put.**

In due course a CMI Report containing the final “00” Series tables will be published. This Report will take account of comments received, up to the time of drafting, should any further explanation or clarification be required.

Any comments on this Working Paper should be submitted to:

Simon Spencer  
CMI  
Cheapside House  
138 Cheapside

or via email to [newtables@cmib.org.uk](mailto:newtables@cmib.org.uk).

## Assured lives tables – feedback on Working Paper 12

The Working Party received three written responses to Working Paper 12. A summary of the main points raised follows.

### *Lack of an accident hump*

There was some concern that the proposed assured lives tables for males did not contain an ‘accident hump’ at younger ages (late teens/early twenties).

As there were virtually no deaths below the high 30s of age – and none at all for many of these ages – the Working Party has no evidence either way about the existence or otherwise of an accident hump. There was no deliberate decision not to include this feature in the tables – the shape of the curves are a result of the fit to the bulk of the data and the need to maintain consistency between the different sections.

The Working Party has though considered population data, specifically the interim life tables issued by the Government Actuary’s Department for the periods 1999-2001 and 2000-2002, and has concluded that these show more of an accident ‘plateau’ than a ‘hump’. This is similar to the shape arising from the graduated rates in Working Paper 12. The Working Party is therefore comfortable with the rates produced and feels that no further adjustment is required. Individual actuaries who feel this is inappropriate may wish to make suitable adjustment to the base tables.

### *Extrapolation at the oldest ages*

Comments were made about the appropriateness of the mortality rates at the very oldest ages.

The Working Party had absolutely no CMI data at the very oldest ages above the low 100s, and the available data above about age 90 was scanty and unreliable. The behaviour of the fitted functions at ages well removed from the bulk of the data could be arbitrarily bad and clearly needed to be adjusted. The Working Party therefore considered alternative studies into old age mortality and took a pragmatic approach to ending the tables in, hopefully, a reasonable and consistent way. The Working Party does not claim that the rates at such advanced ages are “correct”. For practical purposes, the Working Party does not believe that the mortality rates assumed for centenarians will be financially significant, and in the absence of a clearly better alternative does not propose to change the method adopted.

### *Relationships between smoker statuses and select durations*

Some concerns were raised about the relationships between the smoker, non-smoker and combined rates, and between the rates at different select durations, particularly at the extremes of age.

Very low data volumes at the extremes of age and at the shorter durations made it impossible to produce sensible rates that adhered faithfully to the data outside the main (financially significant) age range. The method chosen maintains desirable relationships at all ages between the different sections – i.e. non-smoker < combined < smoker, duration 0 < duration 1 < ..., etc.

Alternative approaches were considered, but none produced rates that are materially different outside the main age range or that are clearly preferable at the extremes of age. The Working Party therefore does not see a compelling reason to amend the approach taken.

#### *Calculation of $q_x$ from $\mu_x$*

It has been suggested that the method for deriving values of  $q_x$  from the graduated formulae for  $\mu_x$  are not sufficiently accurate.

For the original proposals, values of  $q_x$  were derived from  $\mu_x$  by using the formula:

$$q_x = 1 - e^{-\int_0^1 \mu_{x+t} dt}$$

using Simpson's rule to evaluate the integral as follows:

$$\int_0^1 \mu_{x+t} dt \approx [\mu_x + 3\mu_{x+\frac{1}{3}} + 3\mu_{x+\frac{2}{3}} + \mu_{x+1}] / 8.$$

The following more accurate approximation is now used:

$$\int_0^1 \mu_{x+t} dt \approx [7\mu_x + 32\mu_{x+\frac{1}{4}} + 12\mu_{x+\frac{1}{2}} + 32\mu_{x+\frac{3}{4}} + 7\mu_{x+1}] / 90.$$

This has only affected some values of  $q_{118}$  and  $q_{119}$  in the sixth decimal place.

### Derivation of final Assured Lives tables

The following tables have been produced.

| Table | Investigation             | Sex    | Lives/Amounts | Select Period |
|-------|---------------------------|--------|---------------|---------------|
| AMC00 | Permanents – combined     | Male   | Lives         | 2             |
| AMN00 | Permanents – non-smokers  | Male   | Lives         | 2             |
| AMS00 | Permanents – smokers      | Male   | Lives         | 2             |
| AFC00 | Permanents – combined     | Female | Lives         | 2             |
| AFN00 | Permanents – non-smokers  | Female | Lives         | 2             |
| AFS00 | Permanents – smokers      | Female | Lives         | 2             |
| TMC00 | Temporaries – combined    | Male   | Lives         | 5             |
| TMN00 | Temporaries – non-smokers | Male   | Lives         | 5             |
| TMS00 | Temporaries – smokers     | Male   | Lives         | 5             |
| TFC00 | Temporaries – combined    | Female | Lives         | 5             |
| TFN00 | Temporaries – non-smokers | Female | Lives         | 5             |
| TFS00 | Temporaries – smokers     | Female | Lives         | 5             |

After consideration, the Working Party has decided to make a small change to the naming of the tables since the publication of Working Paper 12. The combined tables will now contain the letter “C” (e.g. AMC00 instead of AM00) to maintain consistency with the new smoker and non-smoker tables, and to remove possible ambiguity.

Full details of the methodology used, and the thinking behind it, are given in Working Paper 12 and will not be repeated here. However, for ease of reference a brief summary is provided below.

#### *Ultimate rates*

The Permanent (Investigation 01) and Temporary (Investigation 02) assurance datasets were combined in the ultimate durations: 2+ for the Permanents and 5+ for the Temporaries. This was due to the similarity of these experiences, and is explained further in Working Papers 8 and 12. Separate graduations of values of  $\mu_x$  were produced using the Gompertz-Makeham (“GM”) formulae described in Forfar, McCutcheon and Wilkie (1988) for males and females, and smokers, non-smokers and combined, i.e. six separate sections in all.

Further constraints were then applied to the resulting rates to ensure consistency between the different sections, particularly at the extremes of age where there was very little data. These constraints are summarised below.

At the oldest ages, values of  $\mu_x$  for  $x > 100$  were blended into an arbitrary  $\mu_{120}$  equal to 1 using the formula:

$$\mu_x = \frac{(120-x)^{1.25}}{(120-100)^{1.25}} \times \mu_{100} + \left(1 - \frac{(120-x)^{1.25}}{(120-100)^{1.25}}\right) \times \mu_{120}.$$

Additionally, the rates for smokers and non-smokers were constrained to ensure the following relationship held at all ages, separately for males and females:

$$\mu_x[\text{smoker}] \geq \mu_x[\text{combined}] \geq \mu_x[\text{non-smoker}].$$

A summary of the key statistics for the unadjusted ultimate graduations is given in Tables 1 and 2 below.

Table 1. Unadjusted graduations of the male assured lives ultimate experience: key statistics.

| $\chi^2$                    | 87.22               | 76.15                 | 44.06             |
| Degrees of freedom          | 64                  | 62                    | 54                |
| $p(\chi^2)$                 | 0.0285              | 0.1067                | 0.8308            |

Values of  $q_x$  were derived from the resulting values of  $\mu_x$  using the method described on page 5 above and then rounded to six decimal places. The value of  $q_{120}$  was set equal to 1.

#### Select rates

Two-year select rates for the Permanents and five-year select rates for the Temporaries were produced. This was done by assuming that the mortality rate  $q(x,t)$  at age  $x$  and duration  $t$  (where  $t = 0, 1$  for Permanents,  $t = 0, 1, 2, 3, 4$  for Temporaries) could be expressed as a function of the graduated ultimate rate at age  $x$ ,  $q(x)$ , as follows:

$$q(x,t) = q(x) \times f(x,t).$$

The function  $f(x,t)$  was obtained by smoothing (using rolling averages) another function, denoted  $uf(x,t)$ . The function  $uf(x,t)$  was a fourth-order polynomial in  $x$  plus a term in  $t$  that ensured that the graduated rates at different select durations are parallel.

$$uf(x,t) = [a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4] + b(t).$$

For all except female Temporaries, the polynomial was assumed to apply to the age range  $30 \leq x \leq 80$ , while for ages  $x < 30$  we assume that  $uf(x,t) = uf(30,t)$ , and for ages  $x > 80$  we assume that  $uf(x,t) = uf(80,t)$ . For female Temporaries, which had few deaths at higher ages, age 70 was substituted for age 80.

The smoothed  $f(x,t)$  was then calculated as

$$f(x,t) = [uf(x-2,t) + 2 \times uf(x-1,t) + 3 \times uf(x,t) + 2 \times uf(x+1,t) + uf(x+2,t)] \div 9.$$

The following constraints were applied:

$uf(x,t) \leq 1.0$ ;  $uf(x,0) \geq 0.2$  (we assume that select rates cannot exceed ultimate rates and, arbitrarily, that select duration 0 rates cannot fall below 20% of ultimate rates).

$uf(x,2) = 1.0$  for Permanents.

$uf(x,5) = 1.0$  for Temporaries.

$a_0 = 0$ ;  $a_1 = 0$ ;  $b(0) = 0$ .

$b(t) \geq b(t-1)$ .

$b(t) - b(t-1) \geq b(t+1) - b(t)$ .

Parameters  $a_2$ ,  $a_3$ ,  $a_4$  and  $b(t)$  were then found which maximised the function:

$$\sum_x \sum_t (E_{x,t} \times \log(f(x,t) \times q_x) + (E_{x,t} - A_{x,t}) \times \log(1 - f(x,t) \times q_x)) \quad (1)$$

where  $E$  and  $A$  are the 1999-2002 exposures and actual deaths respectively for the relevant ages and durations, and  $q$  is the graduated ultimate mortality rate.

Separate functions were fitted for the following investigations:-

- Males, Permanents.
- Males, Temporaries.
- Females, Permanents.
- Females, Temporaries.

For non-smokers and smokers a simple adjustment factor was applied to the combined  $uf(x,t)$  before deriving the smoothed  $f(x,t)$ . The adjustment was again found by maximising formula (1), given the parameters  $a$  and  $b$  fitted to the combined experiences. The resulting mortality rates were further constrained to be not greater/lower (as appropriate) than the relevant combined select rates.

The parameters fitted for the various investigations were as follows:-

| Parameter      | Males                |                      | Females              |                      |
|----------------|----------------------|----------------------|----------------------|----------------------|
|                | Permanent Assurances | Temporary Assurances | Permanent Assurances | Temporary Assurances |
| 100,000 $a_0$  | 0.0000               | 0.0000               | 0.0000               | 0.0000               |
| 100,000 $a_1$  | 0.0000               | 0.0000               | 0.0000               | 0.0000               |

Select rates have been assumed to end at age 90+ $t$ , as was the case in the “92” Series tables.

Select values of  $\mu$  have been calculated using the methodology set out in *C.M.I.R. 10*, 31-34. To summarise:

Define, for  $d = 0, 1, \dots, n$ , where  $n$  is the select period in years,

$$q_x^d = q_{[x-d]+d}$$

$$\mu_x^d = \mu_{[x-d]+d}$$

$$\lambda_x^d = -\log(1 - q_x^d).$$

Then, for duration 0,

$$\mu_x^0 = \frac{3\lambda_x^0 - \lambda_{x+1}^1}{2}$$

and, for durations 1-4,

$$\mu_x^d = \frac{\lambda_{x-1}^{d-1} + \lambda_x^d}{2}.$$

### Final tables

The final assured lives mortality tables are set out in Tables A1 to A24 in the Appendix. The ultimate values of  $\mu_x$  are those originally graduated; this marks a change of approach from the “80” and “92” Series where the published values of  $\mu_x$  were recalculated from the published values of  $q_x$ .
