The present in the UK – DC on the rise

- Defined benefit plans are closing (87% are closed in 2016 in UK).
- Most people are now actively in defined contribution plans, or similar arrangement (97% of new hires in FTSE350).
- Contribution rates are much lower in defined contribution plans

Life insurance mathematics 101

- $PV(\text{annuity paid from age 65}) = a_{\overline{T}|}$

- Expected value of the PV is

$$a_{65} = v p_{65} + v^2 {}_2p_{65} + v^3 {}_3p_{65} + v^4 {}_4p_{65} + \dots$$

- To use as the price,
 - Law of Large Numbers holds,
 - Same investment strategy,
 - Known investment returns and future lifetime distribution.

21

Life annuity contract

- Income drawdown vs life annuity: if follow same investment strategy then life annuity gives higher income*

*ignoring fees, costs, taxes, etc.

- Pooling longevity risk gives a higher income.
- Everyone in the group becomes the beneficiaries of each other, indirectly.

Aim of modern tontines

- Aim is to provide an income for life.
- It is not about gambling on your death or the deaths of others in the pool.
- It should look like a life annuity.
- With more flexibility in structure.
- Example is based on an explicitly-paid longevity credit.

Institute
and Faculty
of Actuaries

5 June 2018

28

Example 0: Simple setting of 4% Rule

- Pension savings = £100,000 at age 65.
- Withdraw £4,000 per annum at start of each year until funds exhausted.
- Investment returns = Price inflation + 0%.
- No longevity pooling.

Example 0: income drawdown (4% Rule)

Example 1: Join a tontine

- Same setup except...pool all of asset value in a tontine for rest of life.
- Withdraw a maximum real income of $\pounds X$ per annum for life (we show X on charts to follow).
- Mortality table S1PMA.
- Assume a perfect pool: longevity credit=its expected value.
- Longevity credit paid at start of each year.

5 June 2018

5 June 2018

33

Example 1ii: +2% p.a. investment returns above inflation

Institute
and Faculty
of Actuaries

5 June 2018

34

Example 1iii: Inv. Returns = Inflation – 2% p.a. from age 65 to 75, then Inflation +2% p.a.

Institute
and Faculty
of Actuaries

5 June 2018

35

Example 1iv: Inv. Returns = Inflation – 5% p.a. from age 65 to 75, then Inflation +2% p.a.

Institute
and Faculty
of Actuaries

5 June 2018

36

Example 1

- Tontines:
 - Mitigate risk of outliving savings.
 - Provide a higher income.
- Downside:
 - Loss of bequest. However...

Example 2: Join a tontine

- Same setup except...pool 50% of asset value in a tontine for rest of life.
- Withdraw a maximum real income of £4,036 per annum for life.
- Bequest is higher than under 4% Rule at higher ages.

Example 2: income withdrawn

Overview of entire session

- Motivation
- **One way of pooling longevity risk**
- Discussion

II. One way of pooling longevity risk

- Aim of pooling: retirement income, not a life-death gamble.
- [DGN] method of pooling longevity risk
 - Explicit scheme.
 - Everything can be different: member characteristics, investment strategy.

Longevity risk pooling

Pool risk over lifetime

Individuals make their own investment decisions

Individuals withdraw income from their own funds

However, when someone dies at time $T...$

Institute
and Faculty
of Actuaries

5 June 2018

43

Longevity risk pooling

Share out remaining funds of Bob.

Institute
and Faculty
of Actuaries

5 June 2018

44

Longevity risk pooling rule [DGN]

- $\lambda^{(i)}$ = Force of mortality of i^{th} member at time T .
- $W^{(i)}$ = Fund value of i^{th} member at time T .
- Payment (longevity credit) to i^{th} member:

$$\frac{\lambda^{(i)} \times W^{(i)}}{\sum_{k \in \text{Group}} \lambda^{(k)} \times W^{(k)}} \times \{\text{Bob's remaining fund value}\}$$

Institute
and Faculty
of Actuaries

Overview of entire session

- Motivation
- One way of pooling longevity risk
- **Discussion**

Institute
and Faculty
of Actuaries

Longevity risk pooling [DGN] - features

- There will always be some volatility in the longevity credit:
 - Actual value \neq expected value (no guarantees)
 - But longevity credit ≥ 0 , i.e. never negative.
 - Loss occurs only upon death.
- Volatility in longevity credit can replace investment return volatility.

Longevity risk pooling - features

- Increase expected lifetime income
- Reduce risk of running out of money before death
- Non-negative return, except on death
- Update force of mortality, periodically.

Longevity risk pooling - features

- Actuarially fair for any group of people (via payment to Bob, too)
- ``Cost'' is paid upon death, not upfront like life annuity.
- Mitigates longevity risk, but does not eliminate it.
- Anti-selection risk remains, as for life annuity.

5 June 2018

49

Longevity risk pooling - features

- Under certain conditions*, can re-create a life annuity.

*e.g. correct forces of mortality, Law of Large Numbers holds,...

- Comparing:
 - a) Longevity risk pooling, versus
 - b) Equity-linked life annuity, paying actuarial return $(\lambda^{(i)} - \text{Fees}) \times W^{(i)}$.

Fees have to be $< 0.5\%$ for b) to have higher expected return in a moderately-sized (600 members), heterogeneous group [DGN].

5 June 2018

50

Longevity risk pooling - features

- Splits investment return from longevity credit to enable:
 - Fee transparency,
 - Product innovation.

Longevity risk pooling – some ideas

- Insurer removes some of the longevity credit volatility, e.g. guarantees a minimum payment for a fee [DY].
- Allow house as an asset – monetize without having to sell it before death [DY].

Longevity risk pooling – some ideas

Pay out a regular income with the features:

- Each customer has a ring-fenced fund value.
- Explicitly show investment returns and longevity credits on annual statements.
- Long waiting period before customer's assets are pooled, to reduce adverse selection risk, e.g. 10 years.
- More income flexibility.
- Opportunity to withdraw a lumpsum from asset value.
- Update forces of mortality periodically.

Summary

- Motivation is to provide a higher income in retirement.
- May also result in a higher bequest.
- Reduces chance of running out of money in retirement.
- Transparency may encourage more people to “annuitize”.

57

Example 3 – [DGN] rule in action

- Assume a very small group of four people: A, B, C and D.
- All have the same force of mortality.
- A has the lowest wealth, D has the highest.
- Look at what happens when one of them dies.
- This is for illustration only – I am not recommending operating a tontine with 4 people.

Institute
and Faculty
of Actuaries

5 June 2018

58

Example 3(i): A dies

Member	Force of mortality	Fund value before A dies	Force of mortality x Fund value	Longevity credit from A's fund value = $100 \times (4)/\text{Sum of (4)}$	Fund value after A dies
(1)	(2)	(3)	(4)	(5)	(6)
A	0.01	100	1	10	$10 = 100 - 100 + 10$
B	0.01	200	2	20	$220 = 200 + 20$
C	0.01	300	3	30	$330 = 300 + 30$
D	0.01	400	4	40	$440 = 400 + 40$
Total		1000	10	100	1000

Institute
and Faculty
of Actuaries

5 June 2018

59

Example 3(ii): D dies

Member	Force of mortality	Fund value before D dies	Force of mortality x Fund value	Longevity credit from D's fund value = $400 \times (4)/\text{Sum of (4)}$	Fund value after D dies
(1)	(2)	(3)	(4)	(5)	(6)
A	0.01	100	1	40	$140 = 100 + 40$
B	0.01	200	2	80	$280 = 200 + 80$
C	0.01	300	3	120	$420 = 300 + 120$
D	0.01	400	4	160	$160 = 400 - 400 + 160$
Total		1000	10	400	1000
