

# Cat Modelling Update from AIR

Dr Milan Simic  
Managing Director  
**AIR Worldwide Ltd**

# Agenda

- Update from AIR on 2010
  - US/Atlantic Hurricane
  - EU Windstorm
  - Japan/NW Pacific Typhoon
- Update from AIR on 2011
  - EU Earthquake
  - EU Flood
  - Big push on Solvency II
- Update on recent cat events
  - Chile 2010
  - New Zealand 2010 and 2011
  - Japan 2011

# 2010 – US/Atlantic Hurricane

# 2010 Featured an Updated Basinwide Catalog for All North Atlantic Tropical Cyclone Models

Hurricane Wilma impacted the Caribbean, Mexico and Florida

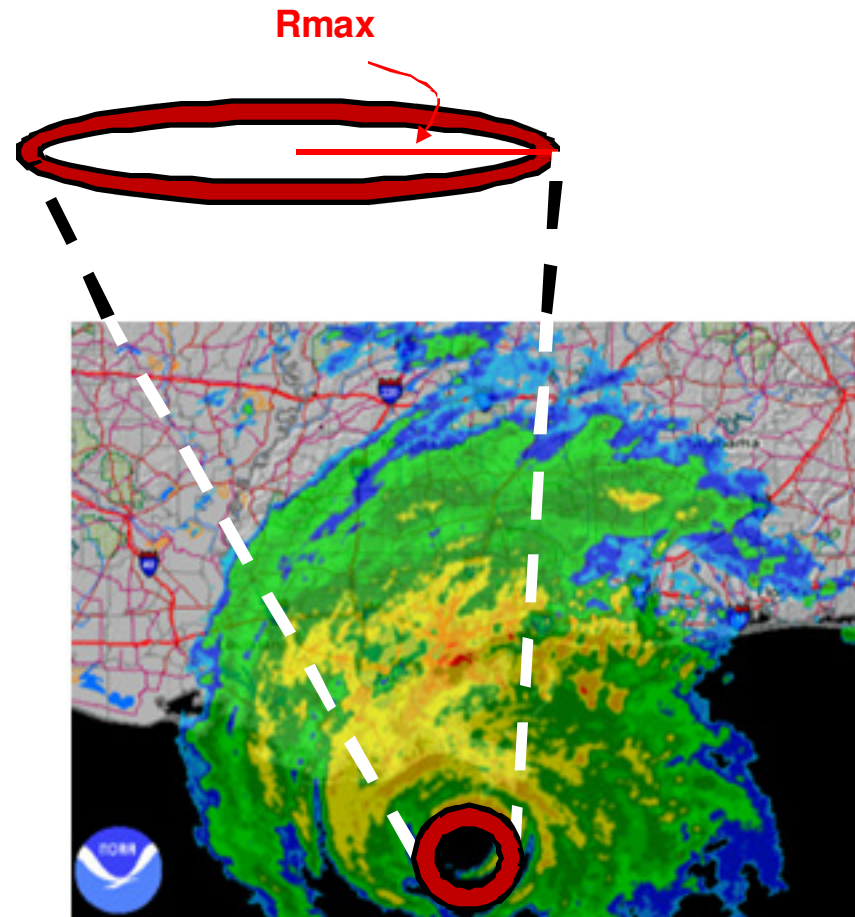

- 30% of storms impact multiple regions
- Consistent Event IDs across Atlantic TC models
  - U.S. Hurricane
  - U.S. Hurricane for Offshore Assets
  - Caribbean TC
  - Mexico TC

**Key Takeaway:**  
Basinwide catalog enables more accurate loss estimates for portfolios spanning multiple countries

# Update to the Rmax Estimation and Addition of Rmax Evolution Based on High Resolution Radar Imagery

<http://www.usgcrp.gov/usgcrp/images/ocp2007/gallery-large/pages/3D-hurricane.htm>

# Spatial Variation in the Downward Transfer of Gradient Winds to the Surface Based on Dropsonde Observations

## Updated Methodology Using Dropsonde Data Results in Changes in Wind Speed at the Periphery of the Storm

- Recent research by Mark Powell and others documents similar reduction patterns using Stepped Frequency Microwave Radiometers (SFMR)
- The research by Powell provides methodology for quantifying these observations, which are related to the slant of the storm structure

# Explicit Modeling of the Influence of Wave Action on Surface Roughness Based on New Data and Research

**Intense Waves Generated by Higher Wind Stress**

**Moderate Waves**

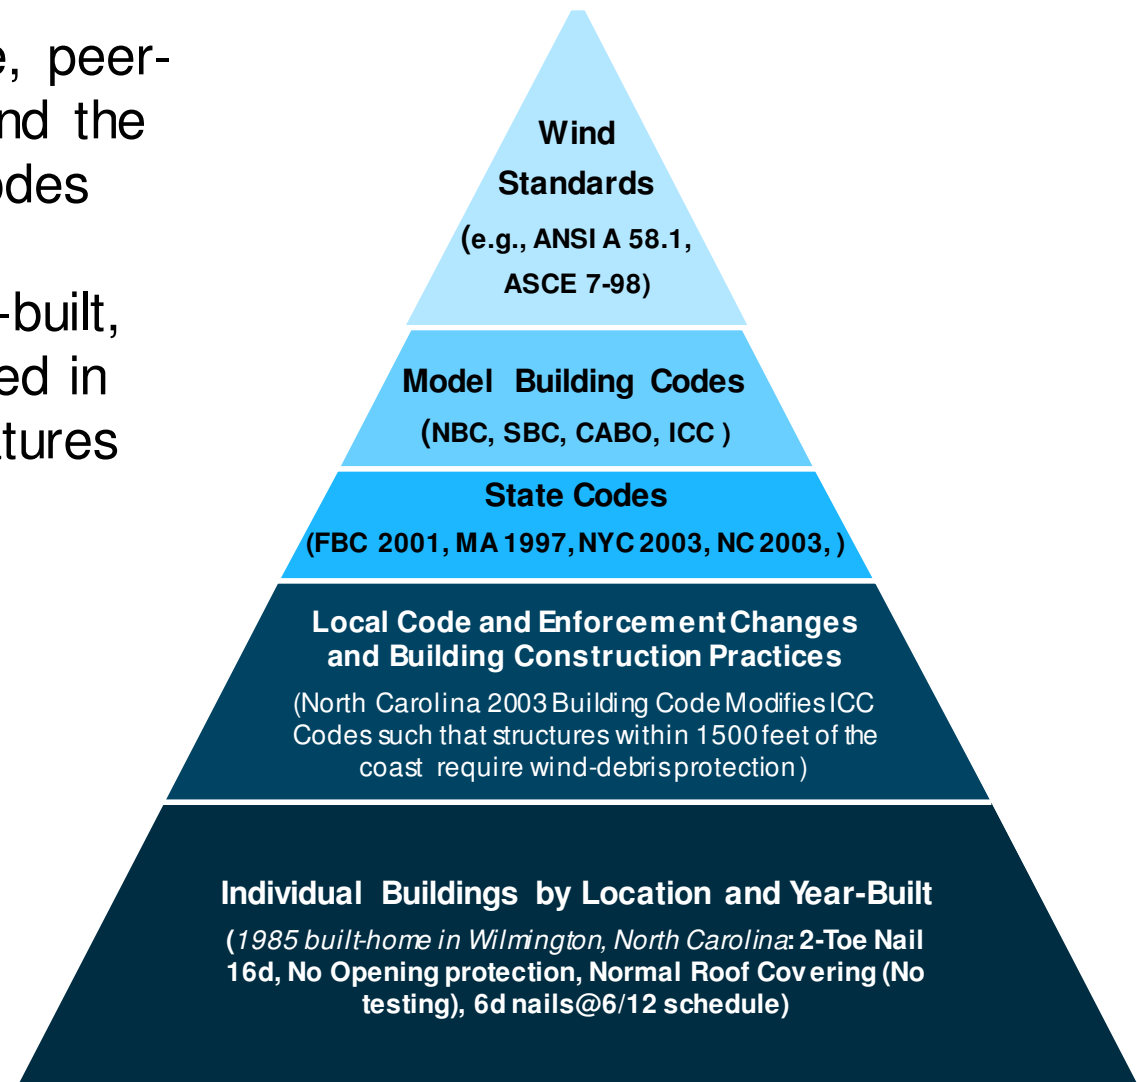

# An Unprecedented Set of Observation Data Enables More Robust and Detailed Hazard Validation

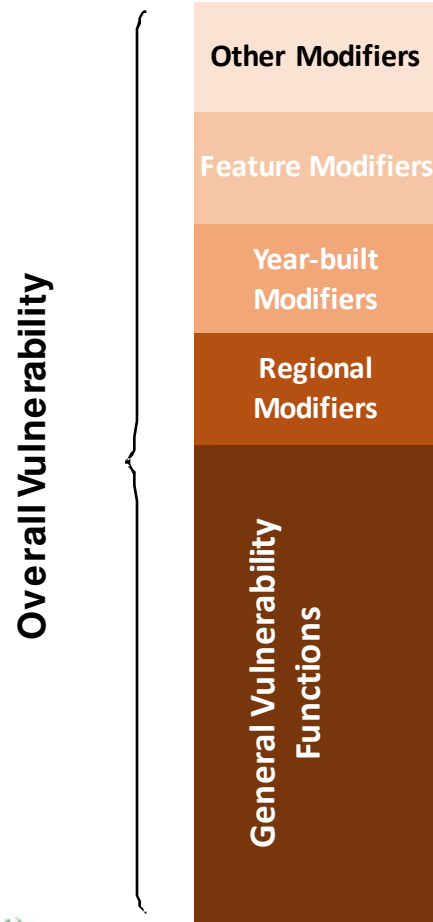

# AIR Implemented a Comprehensive Approach to Model Spatial and Temporal Variations in Vulnerability

- AIR undertook an extensive, peer-reviewed study to understand the large number of building codes and standards that exist
- For each location and year-built, *model buildings* were defined in terms of secondary risk features such as roof covering type

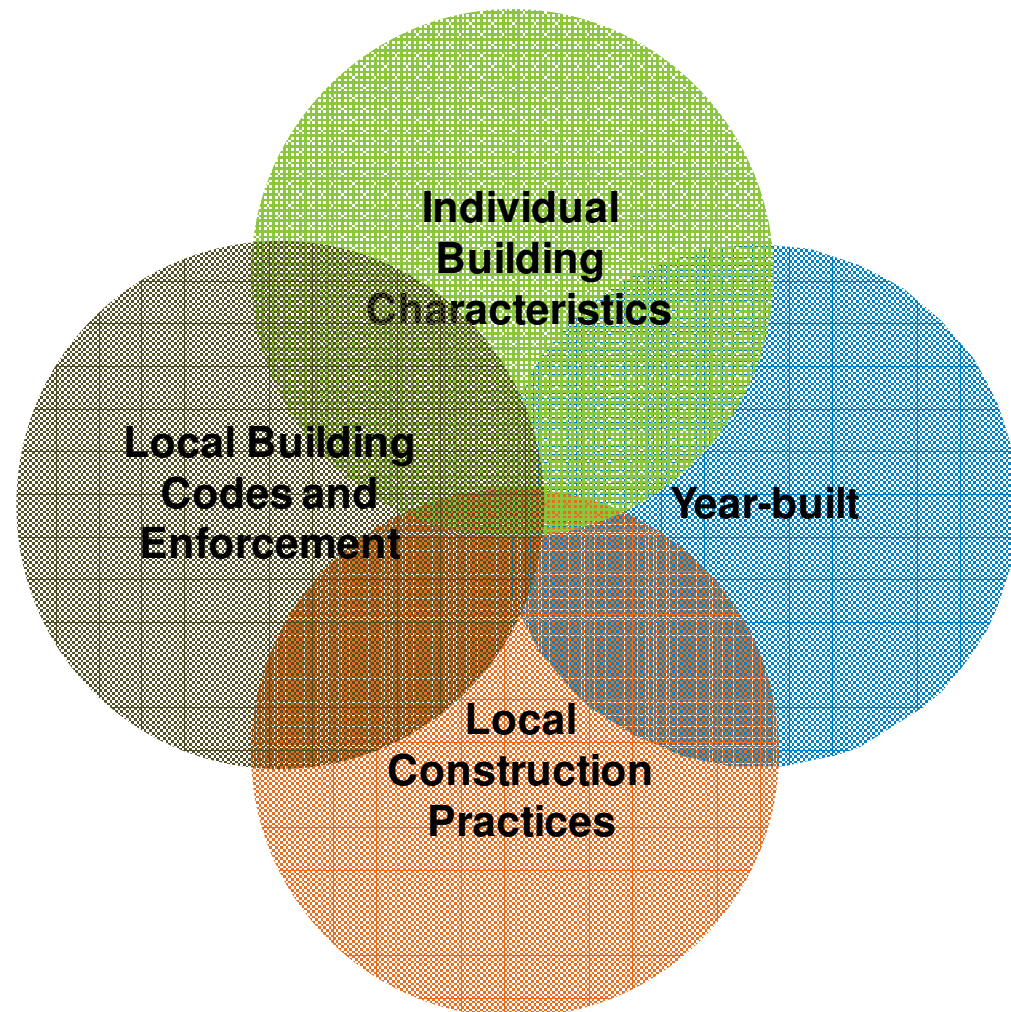

# A Coherent Approach to Modeling Vulnerability Better Captures the Impact of Interrelated Building Characteristics

## Typical Approach

## AIR Enhanced Approach

# 2010 - European Windstorm

# Extratropical Cyclones Have Complex Structures

# Only Numerical Weather Prediction (NWP) Can Capture Vertical Elements within the Storm That Lead to Enhanced Surface Winds

Klaus – 23 January 2009, 18:00

Update

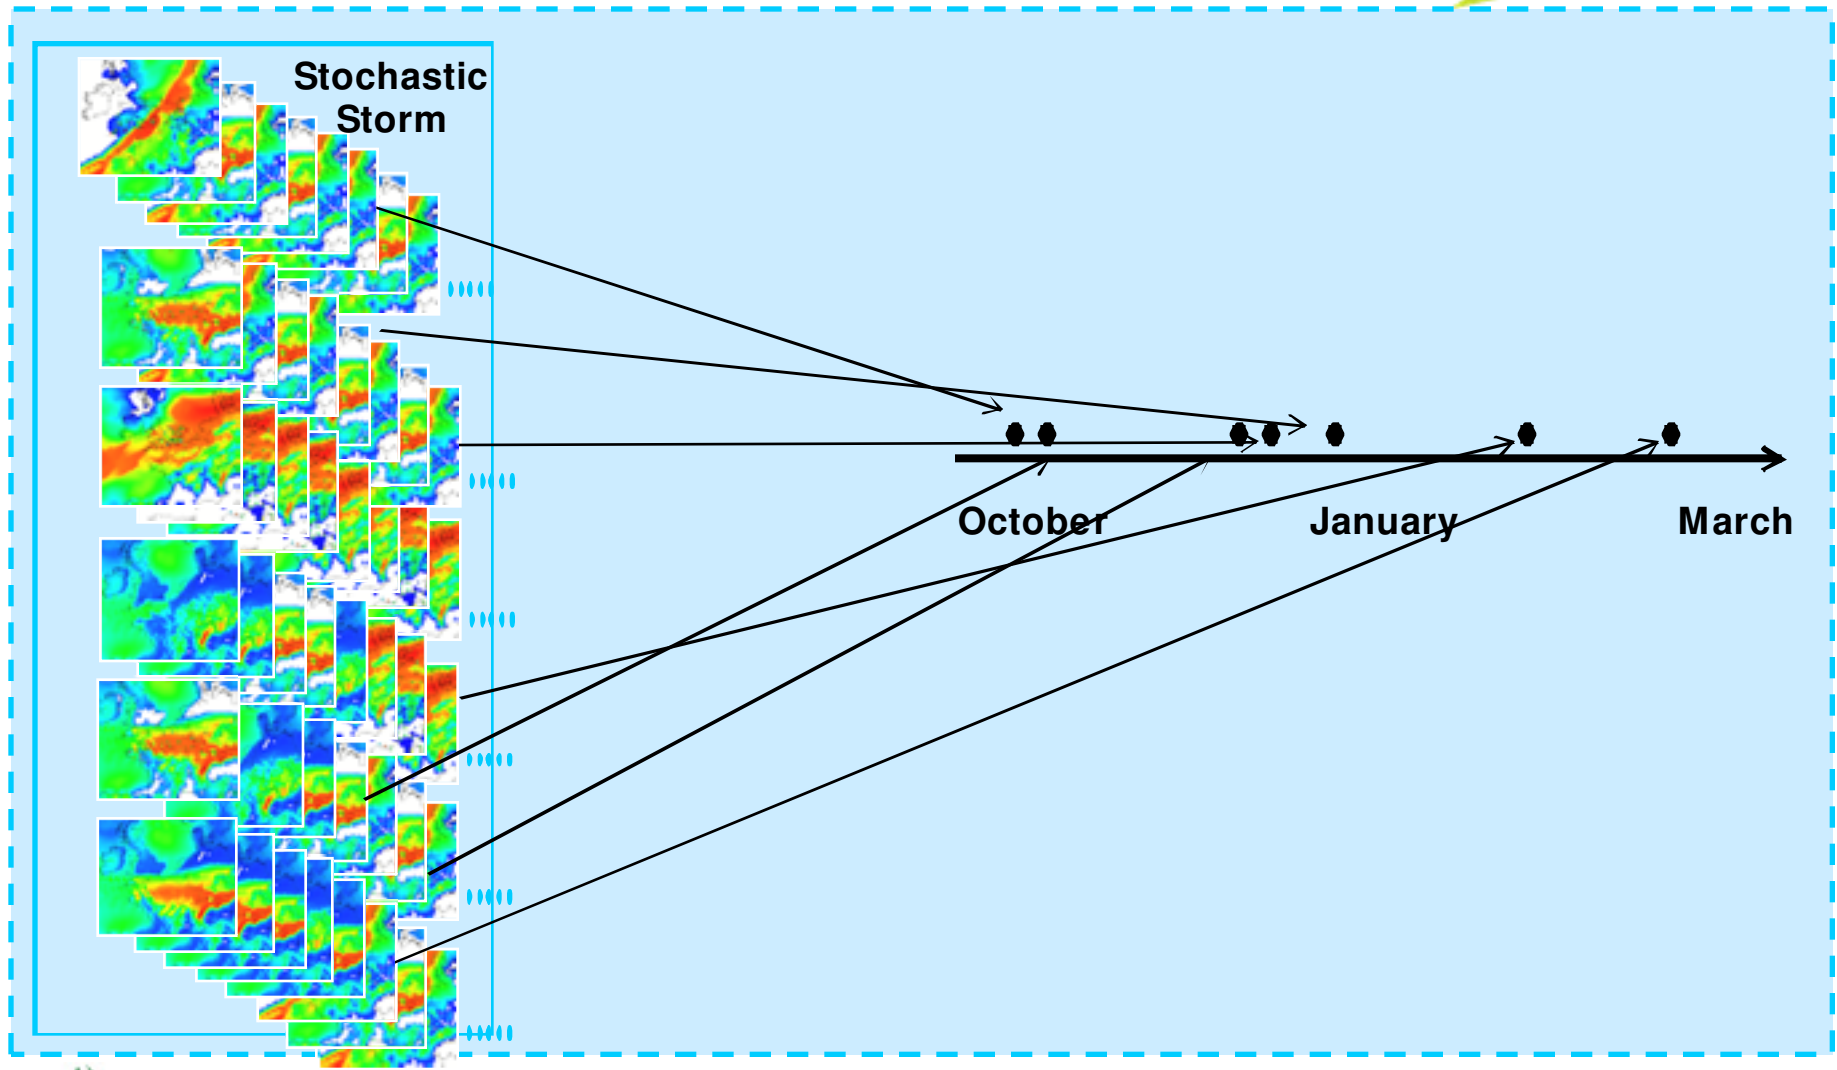

**M O D E L   D E V E L O P M E N T   T I M E L I N E**

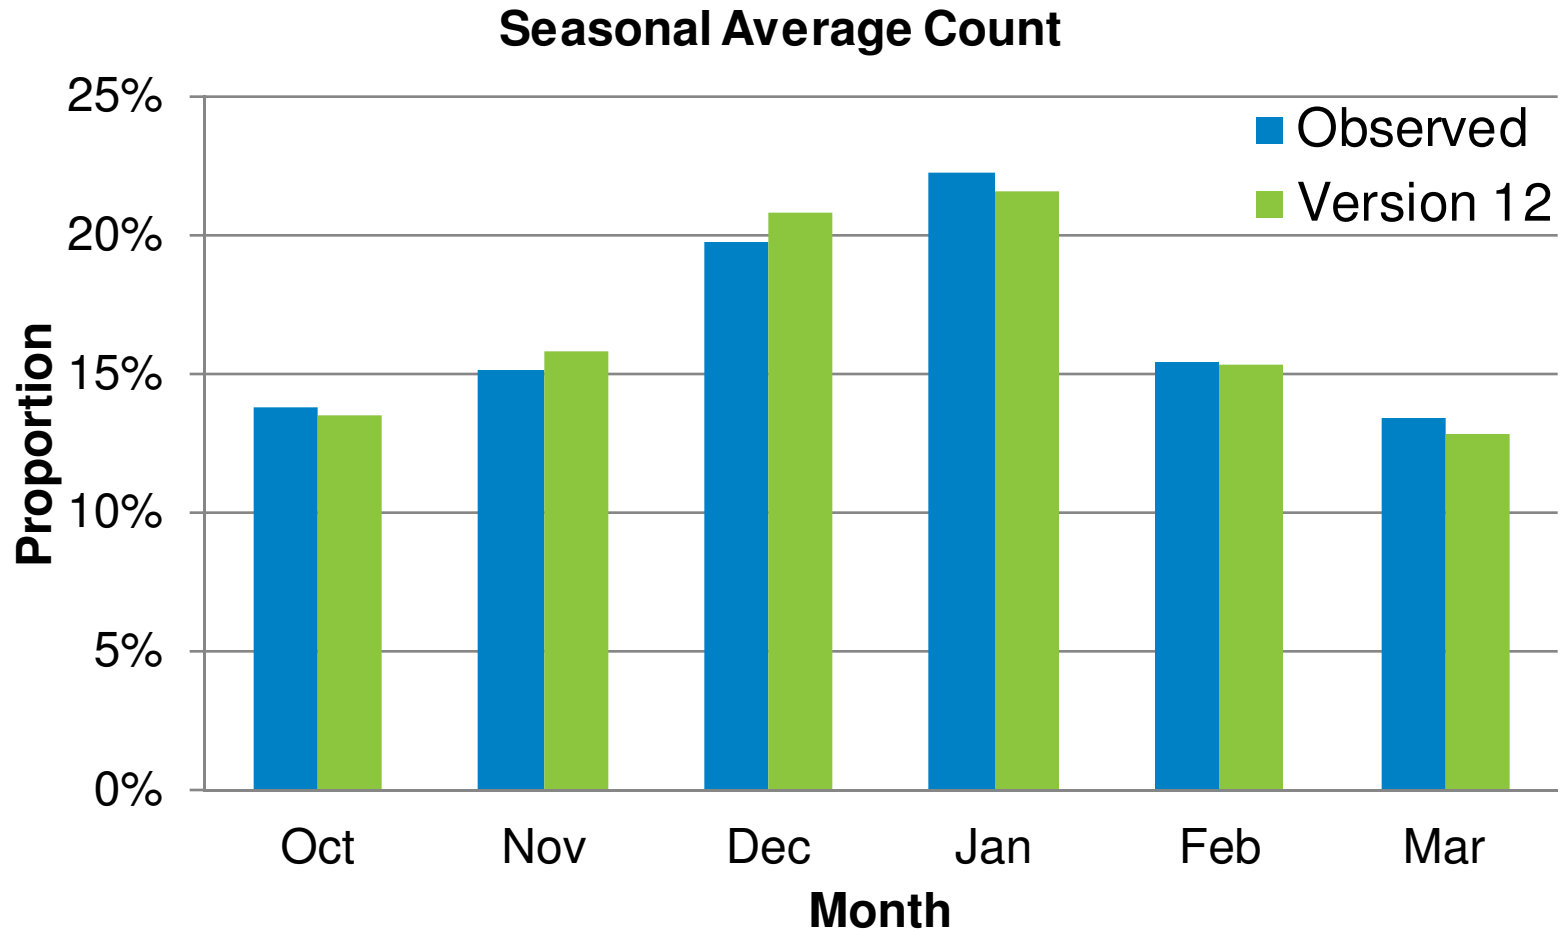

# Stochastic Storm Generation Begins with Evolution of 1500 Historical Storms in Space and Time

# ...and Helps Create a Better Catalogue by Assigning Storm Order

# ...while Also Capturing a Realistic Distribution of Storms Occurring Each Month

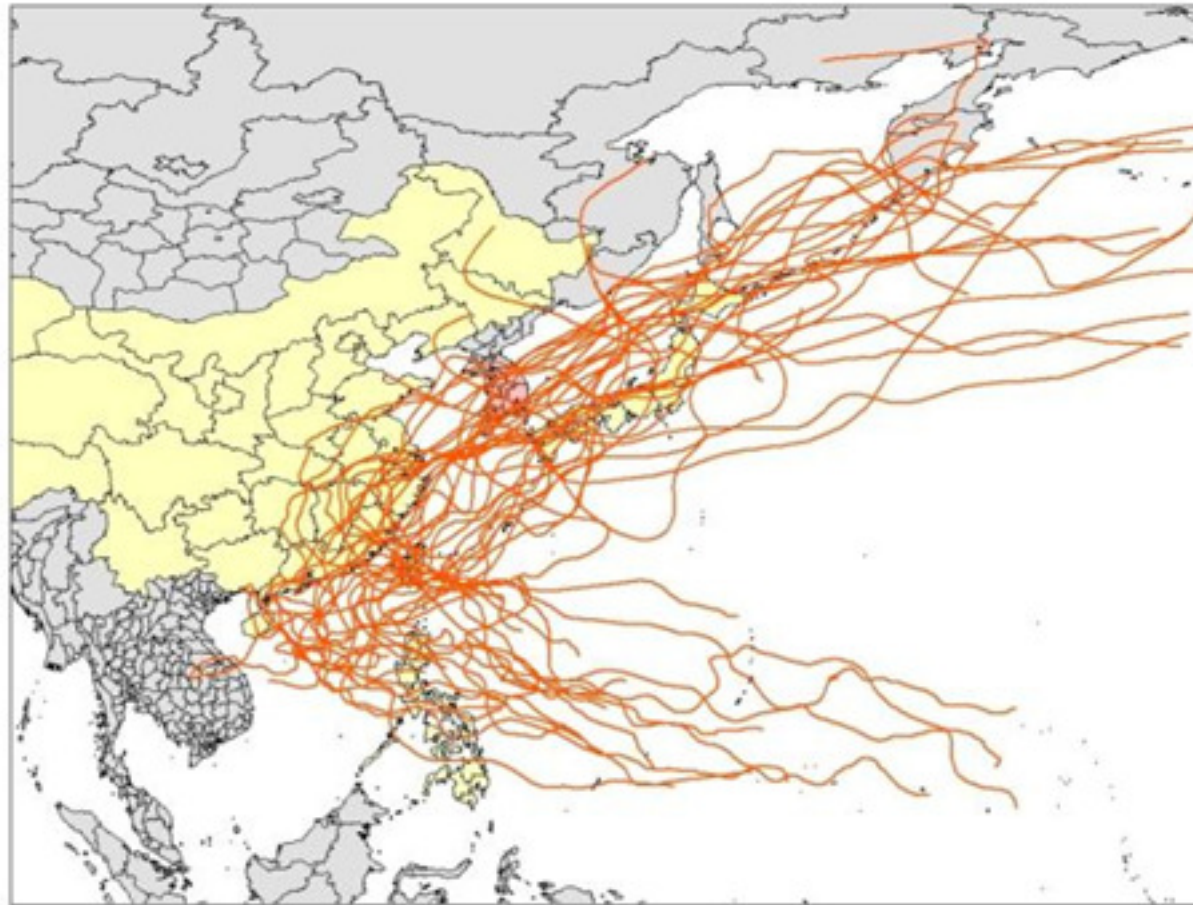

# 2010 - Japan/NW Pacific Typhoon

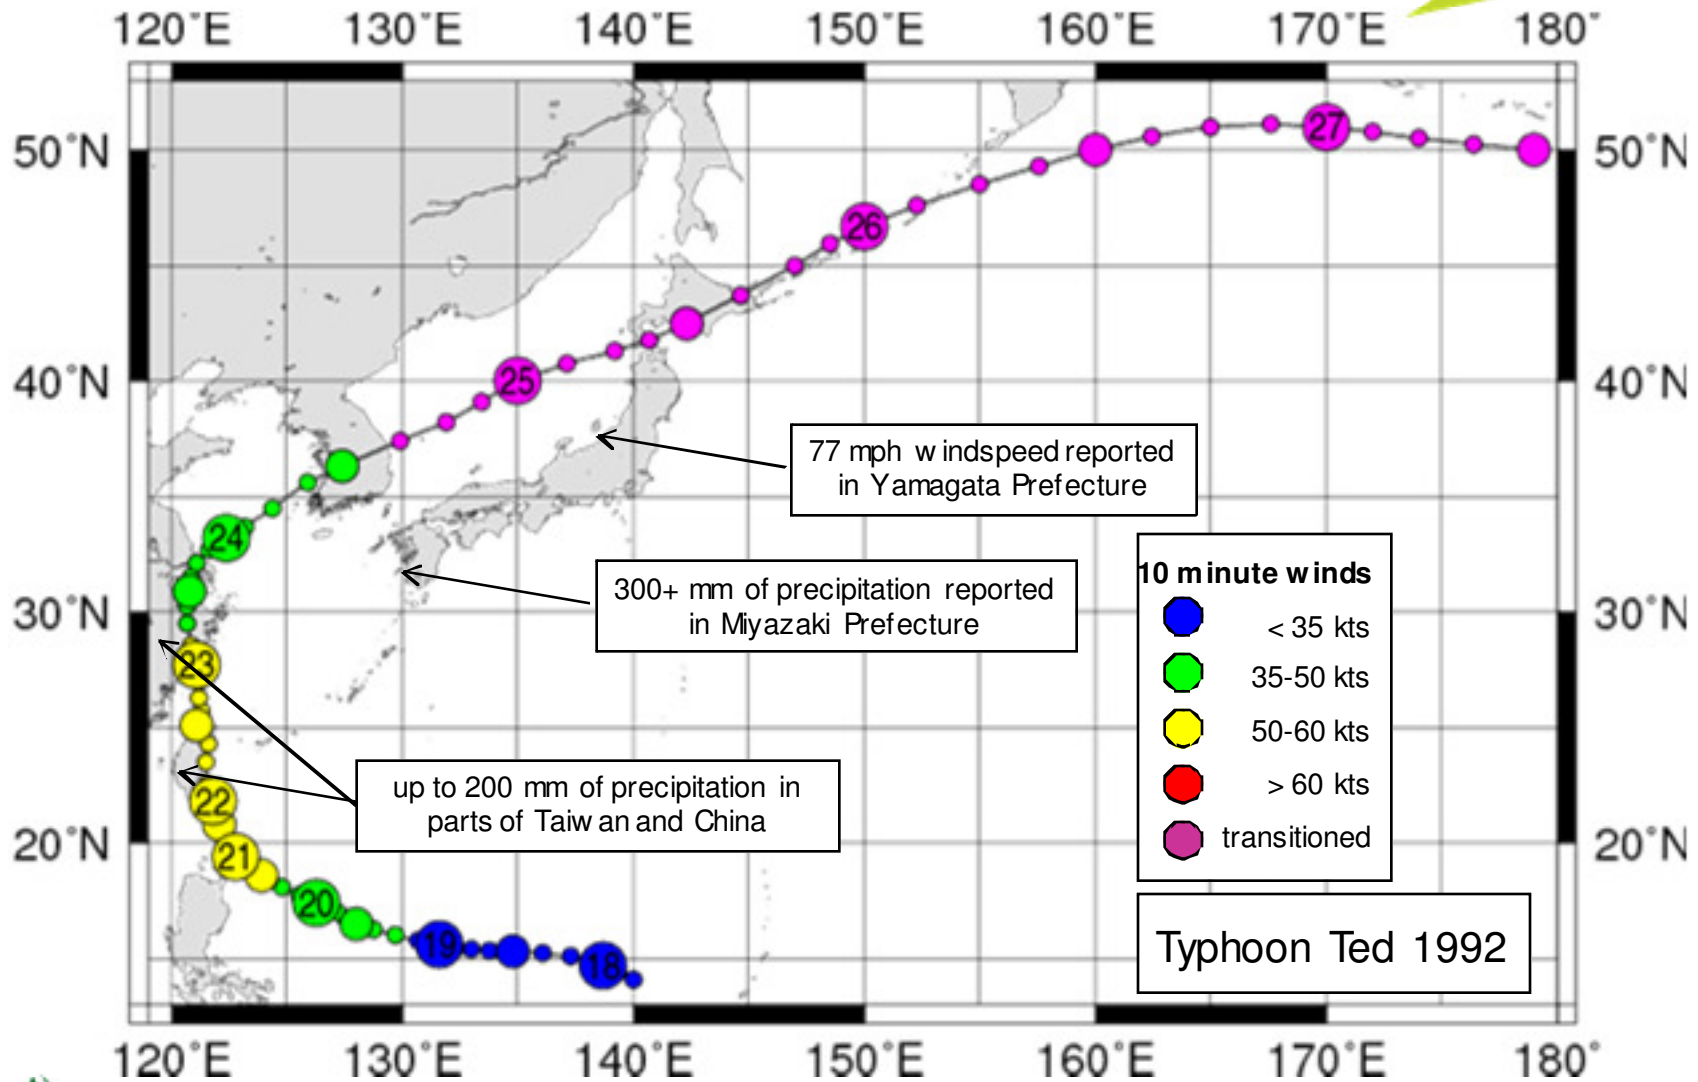

## 2010 Saw the Implementation of a Basinwide Northwest Pacific Typhoon Catalogue

- Basinwide stochastic catalogue for modelling risk in entire region

# Motivation for the Creation of a Basinwide Catalogue

# Morakot (2009) Is a Recent Example of a Typhoon Impacting Taiwan and China – Flooding Was Significant in Both Countries

# Regional Variability in Wind Vulnerability for Non-Engineered Buildings Incorporates Multi-Hazard Characteristics

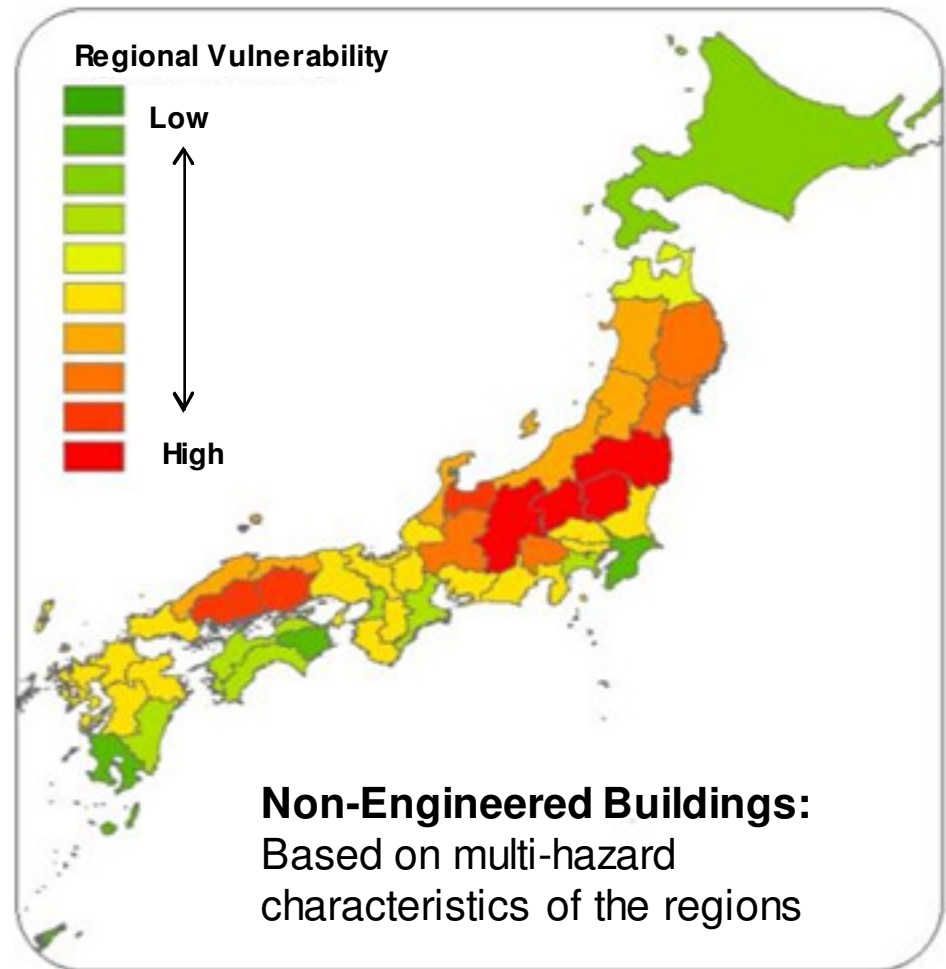

**Regions defined based on basic design code wind speeds**

**Regions defined based on design codes for spectral acceleration**

**Regions defined based on snow depth**

# 2011 – European Earthquake

# AIR Is Significantly Expanding the Domain of the Earthquake Model for Europe

# Seismicity of Europe is Shaped by Complex Interaction between Various Seismotectonic Features

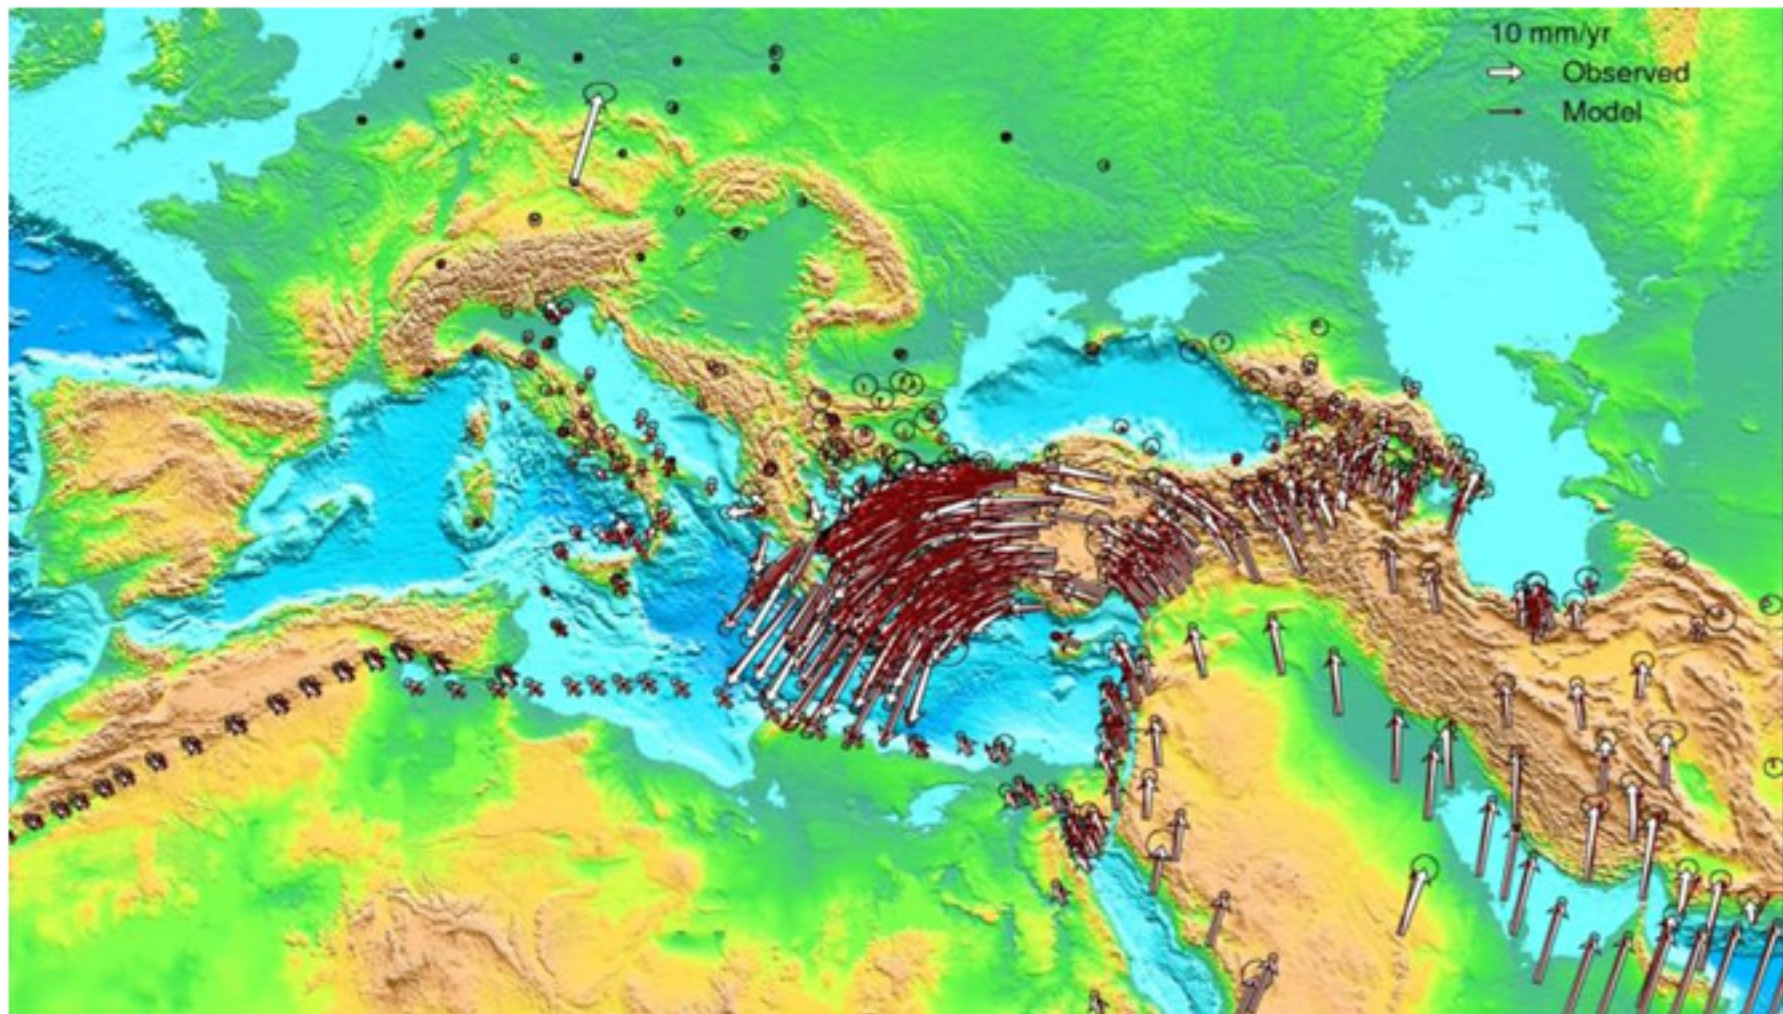

# A Regional Kinematic Model Using GPS, Plate Motion Velocity, and Fault Slip Rate Calculates Strain and Seismic Moment Rates

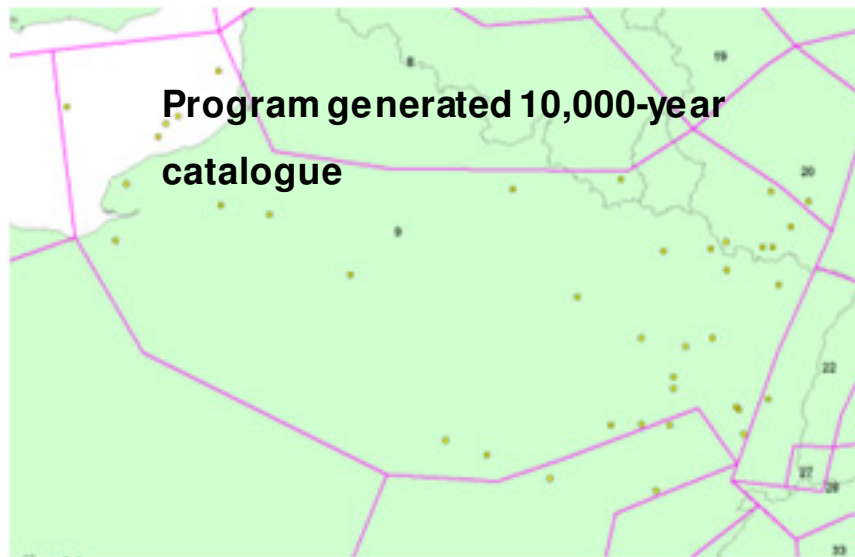

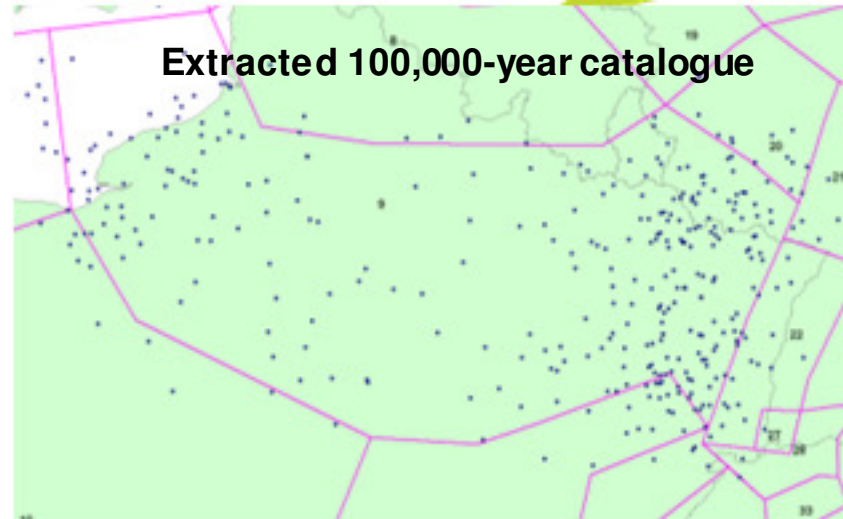

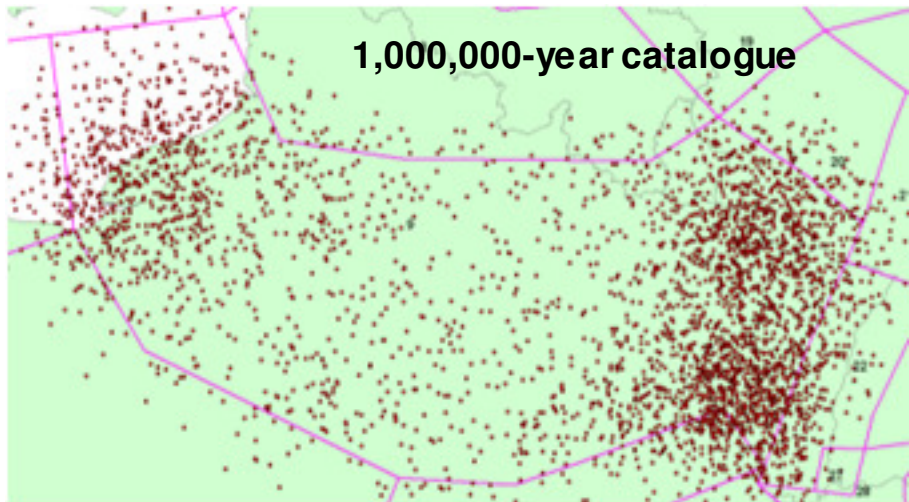

# AIR's Pan European Earthquake Model Realistically Captures Observed GPS Velocities

# AIR's Pan European Earthquake Catalogue is Optimised for Low Seismicity Regions

**Catalogue optimization procedure can obtain a better spatial distribution of events and preserve magnitude-frequency and hazard distribution.**

# Temporal and Spatial Variation of Vulnerability across the Pan-European Region in the AIR Earthquake Model

**1950:** Most countries did not abide by any code. Codes existed in Turkey, Italy, and Romania only

**1955:** Efforts to develop first version of codes in Austria, Bulgaria, France, Israel, and Portugal started

**1960:** First version of code released for Germany, Greece, and Portugal

**1965:** Seismic codes for Austria, Israel, France, and Slovenia released. Codes for Turkey, Bulgaria, and Romania revised

**1970:** Code revised for Romania. Preliminary seismic regulation released for Switzerland

**1975:** Code updated for Italy, Israel, and Turkey. Code released for Slovakia and Czech Republic. Cyprus adopts Turkish code.

**1980:** First code for Hungary released. Code for Austria revised. Romanian code revised after 1977 Vrancea Earthquake

**1985:** Code update for Greece, Portugal, France, Germany, and Slovenia

**1990:** Code updated for Italy and Bulgaria. First versions of code released for Switzerland and Cyprus

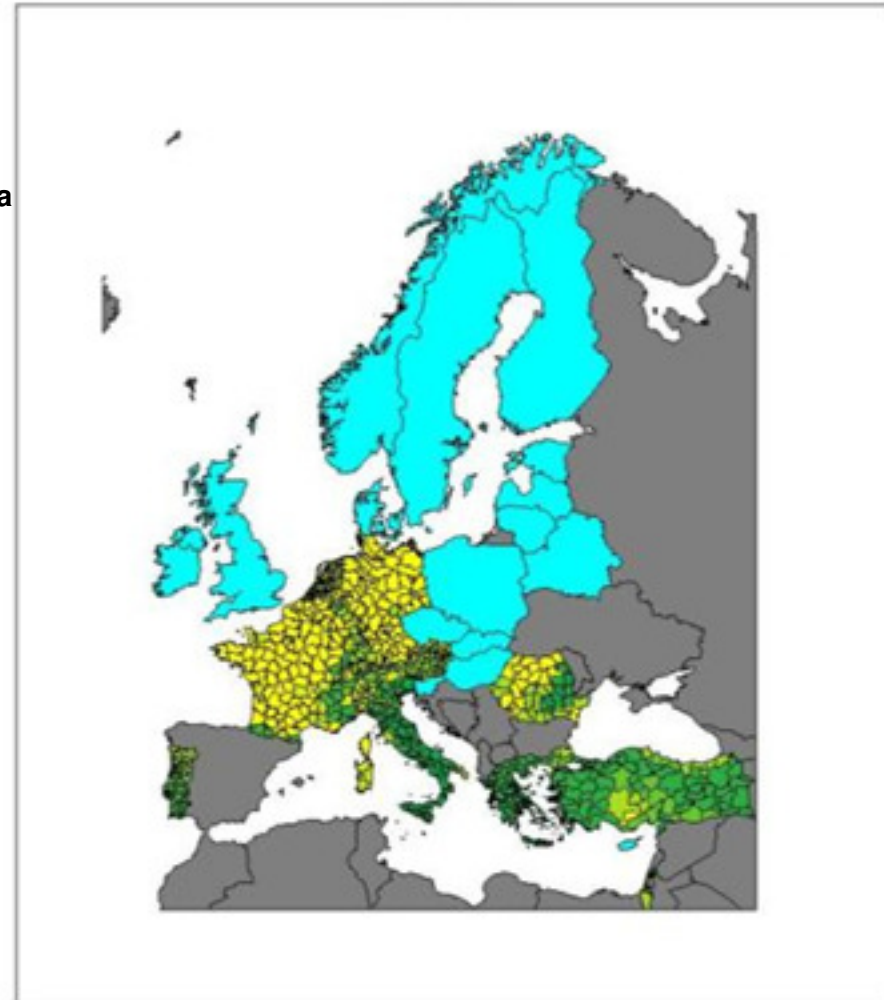

**1995:** Major code update for France, Greece, and Romania

**2000:** Update to Austria, Czech Rep., Slovakia, and Israel. Turkey adopt provisions similar to Eurocode 8

**2005:** Italy, Germany, and Greece adopt provision similar to Eurocode 8. Code update for Hungary and Switzerland

**2010:** Romania and Slovenia adopt provisions similar to Eurocode 8

2010

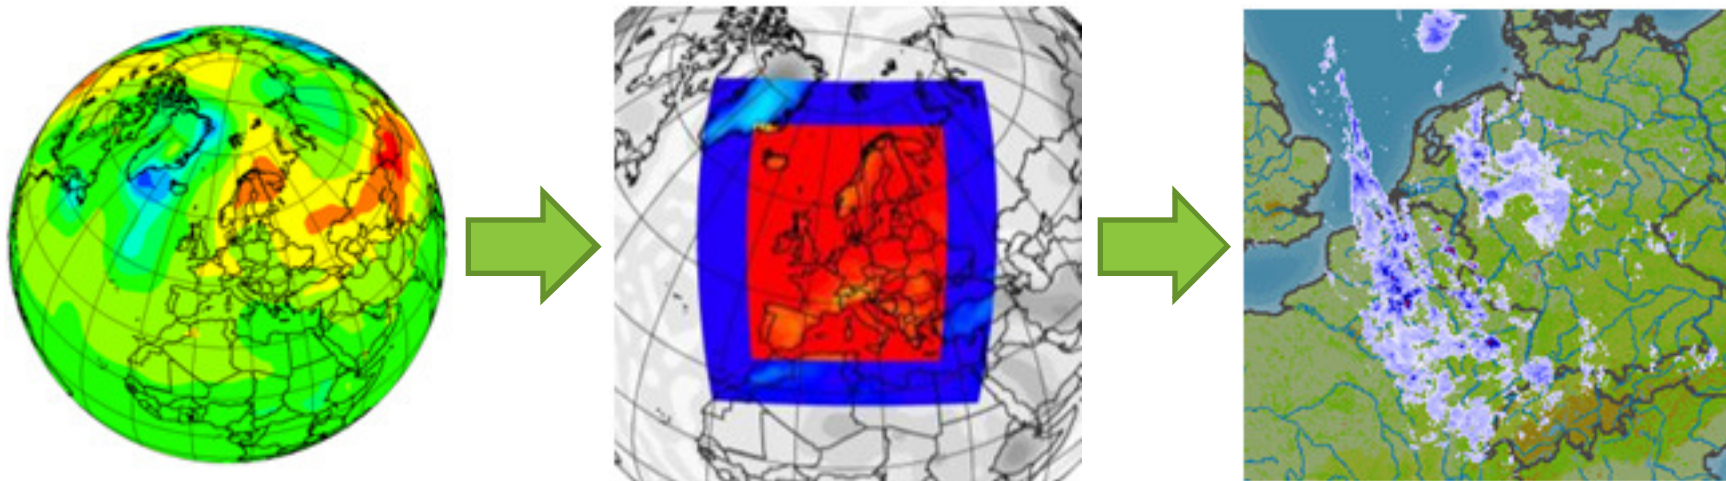

# 2011 – European Flood

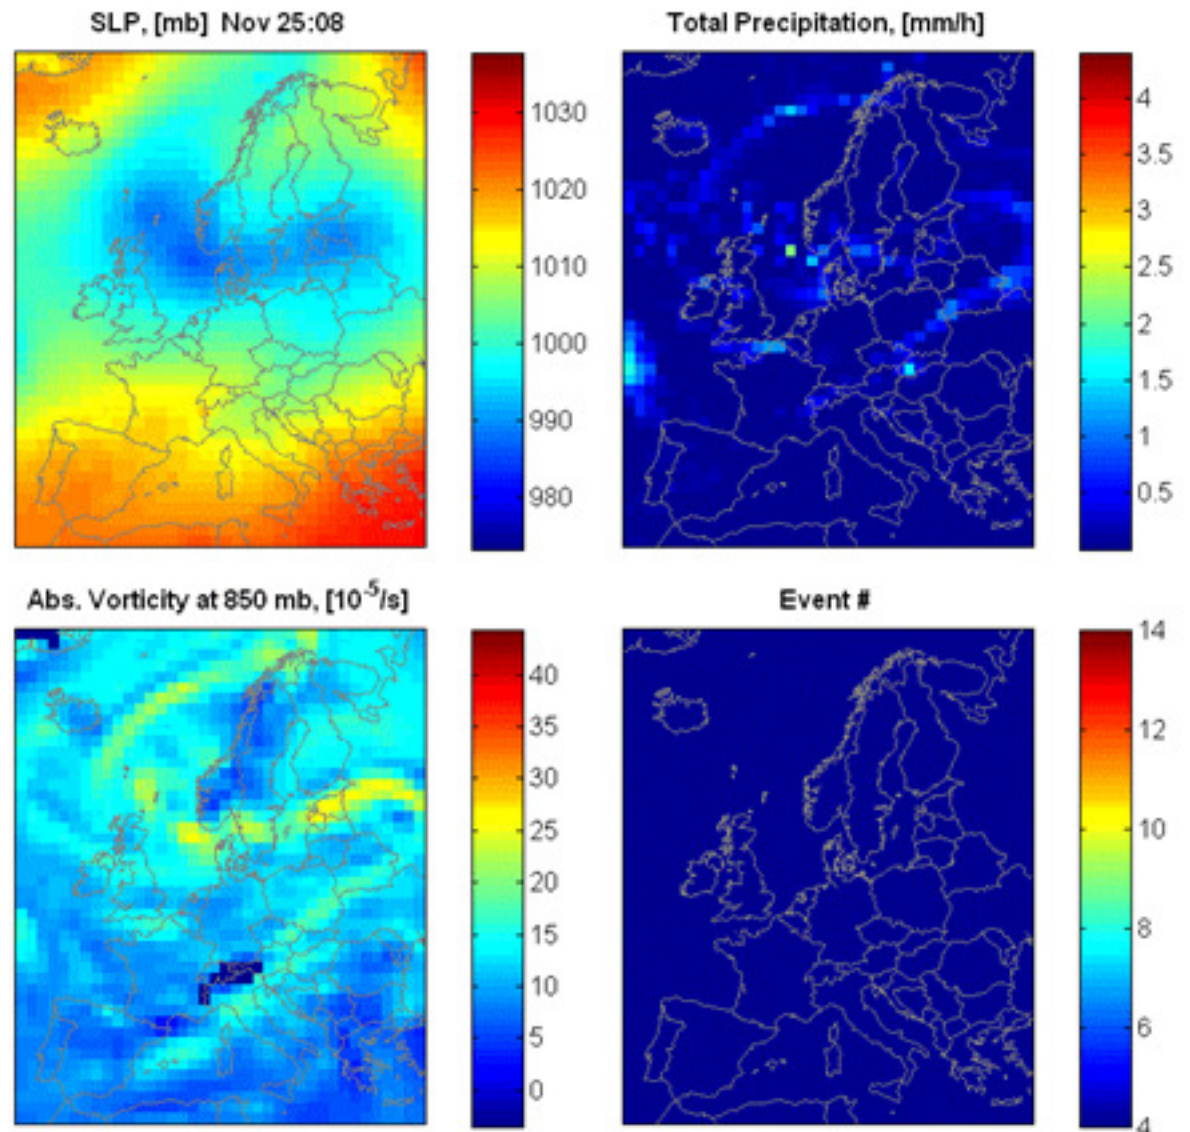

# AIR's Innovative Solution Overcomes the Inherent Challenges of Using a Global Climate Model (GCM)

- Couple GCM at global scale with a NWP model at regional scale to provide coherent large-scale patterns
- Employ sophisticated downscaling techniques to realistically simulate small scale features
- Utilise “quantile mapping” to preserve local rainfall statistics

# AIR Developed a Novel Approach to Separate Storms within Continuous NWP-based Simulations

- Based on space-time analysis of sea level pressure and vorticity
- Provides a unique storm system ID for each spatial and temporal location

# 2011 – Big Push on Solvency II

# AIR Interacts with Regulatory Bodies in Europe

- Creation of AIR website Solvency II host page
- Formation of client steering group
- AIR contributed to the QIS5 effort
- Interaction with FSA, BaFin and other European Regulatory Bodies
- AIR Solvency II Reference Guide is designed to allow clients to quickly navigate to pertinent data

The screenshot displays the AIR Worldwide website interface. At the top, there is a navigation menu with links for 'Home', 'About AIR', 'Industry Solutions', 'Models', 'Software', 'Consulting', 'Data Quality', 'Support', 'Publications', and 'News and Events'. Below the menu, the AIR Worldwide logo is prominently displayed. A central section features a grid of images and text, including 'Advanced Science', 'Risk Modeling', and 'Decision Solutions'. On the right side, there are several featured content boxes: 'AIR WORLDWIDE' with a 'Continuum February 2011 Extrude' link, '2011 AIR Client Conference Boston' with a 'Click here to register' link, 'PERSPECTIVES' with the text 'Model Change: Albatross or Opportunity?' and a 'Click here to read more' link, and 'Solvency II' with a 'Click here for information (Client Access Required)' link. The Solvency II section includes a photograph of classical columns.

# Update on Recent Cat Events

# ALERT™ (AIR Loss Estimates in Real Time)

- Provides real-time loss estimates
- Industry losses estimated for the most likely scenarios
- Posted on ALERT website as detailed hazard and loss maps
- Files containing all scenarios can be downloaded and input directly into AIR software for further analysis of company-specific losses

## ALERT™ WORLDWIDE

### Recent Events

- Brisbane Floods** [January 12, 2011]  
Following on the heels of the Queensland floods that began in late November and the landfall of tropical cyclone Tasha in late December, residents of Brisbane, Australia—the country's third-largest city—are bracing for what State Premier Anna Bligh has described as the region's worst natural disaster. The latest round of flash flooding has been brought on by weeks of rain, which brought the nearby Wivenhoe Dam to its capacity and burst the banks of the Brisbane River. Flood waters have inundated 34 of the city's suburbs, causing thousands to flee to evacuation centers. The local government is estimating that as many as 40,000 commercial and residential properties may be flooded over the next few days. Power has been cut to more than 100,000 households due to safety concerns. The floods have killed 16 people so far, at least 23 people are missing.
- Chile Earthquake** [January 3, 2011]  
Yesterday afternoon, local time, an M7.1 earthquake struck the central coastal area of Chile, approximately 70 kilometers southeast of the city of Temuco, capital of Chile's Biobío Region (southeast of the Andes).

MONDAY, JANUARY 24, 2011

# Mw 8.8 Maule Earthquake Affected a Very Large Area

# Summary of ALERT Loss Estimates for the Maule Earthquake

## M 8.8 MAULE Region of Chile (February 27, 2010)

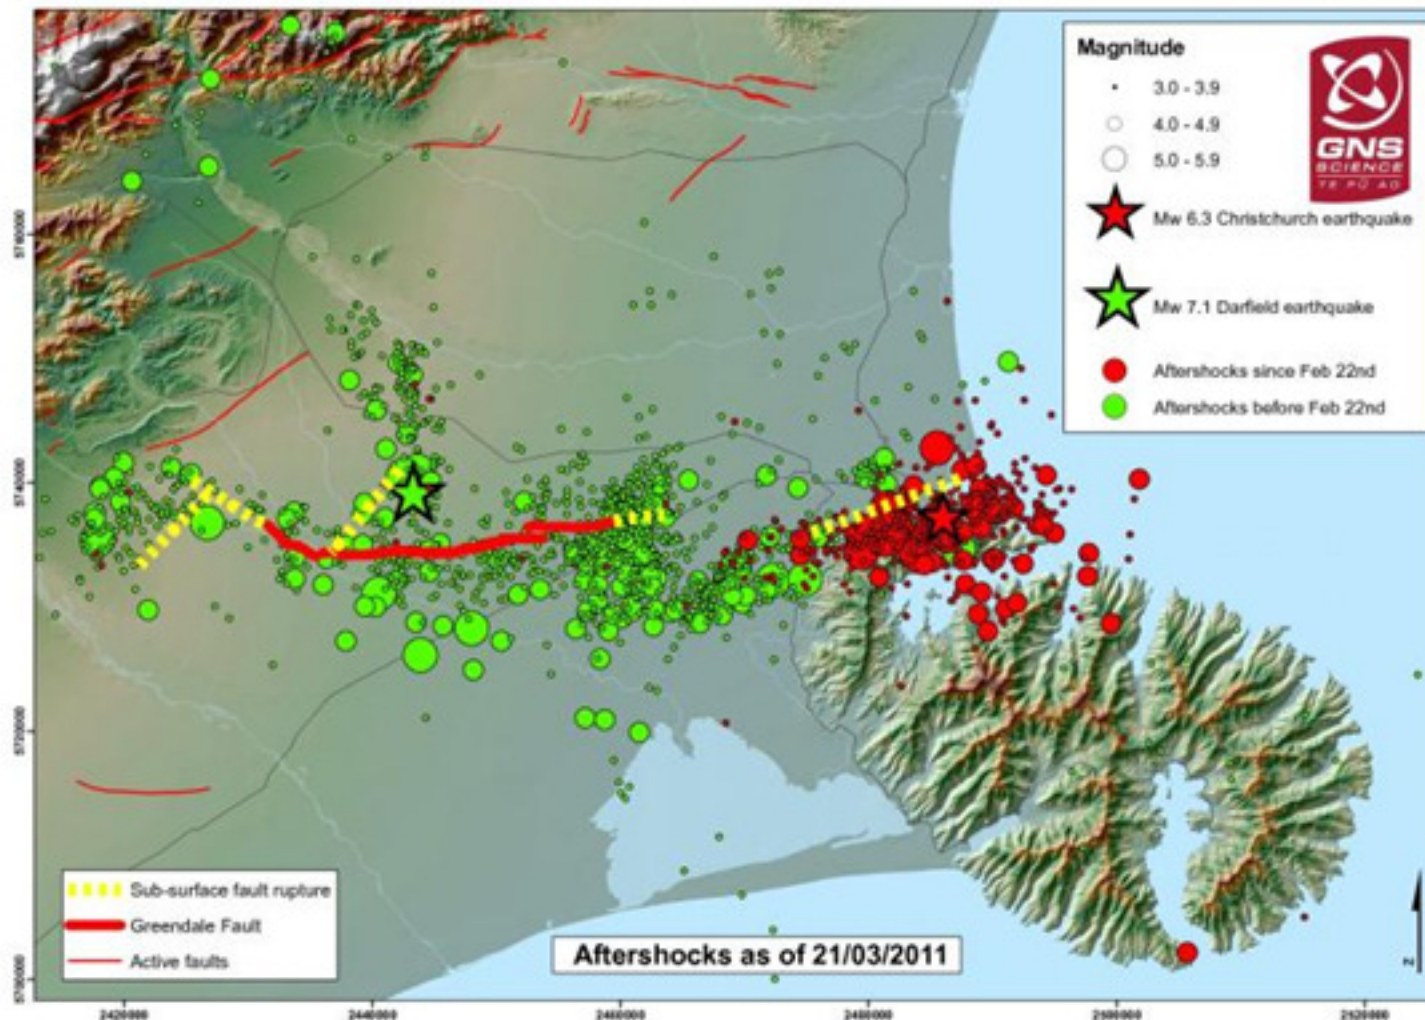

\*AIR industry insured loss estimate for property lines excluding infrastructure  
 ©2011 AIR WORLDWIDE

CONFIDENTIAL: For the exclusive use of the Actuarial Profession 2011 Conference attendees

# Summary of the Mw 7.1 (4 September 2010) and Mw 6.3 (22 February 2011) Christchurch Earthquakes

# How Easy It Is to Estimate New Zealand AAL from Historical Events?

## Large New Zealand Earthquakes

Notable shallow (generally less than 20km deep) earthquakes since 1848

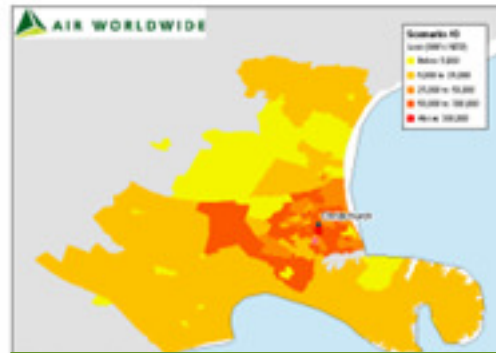

### Historical AALs:

- 1900 – August 2010: 409m NZD
- 1900 – October 2010: 454m NZD
- 1900 – March 2011: 545m NZD

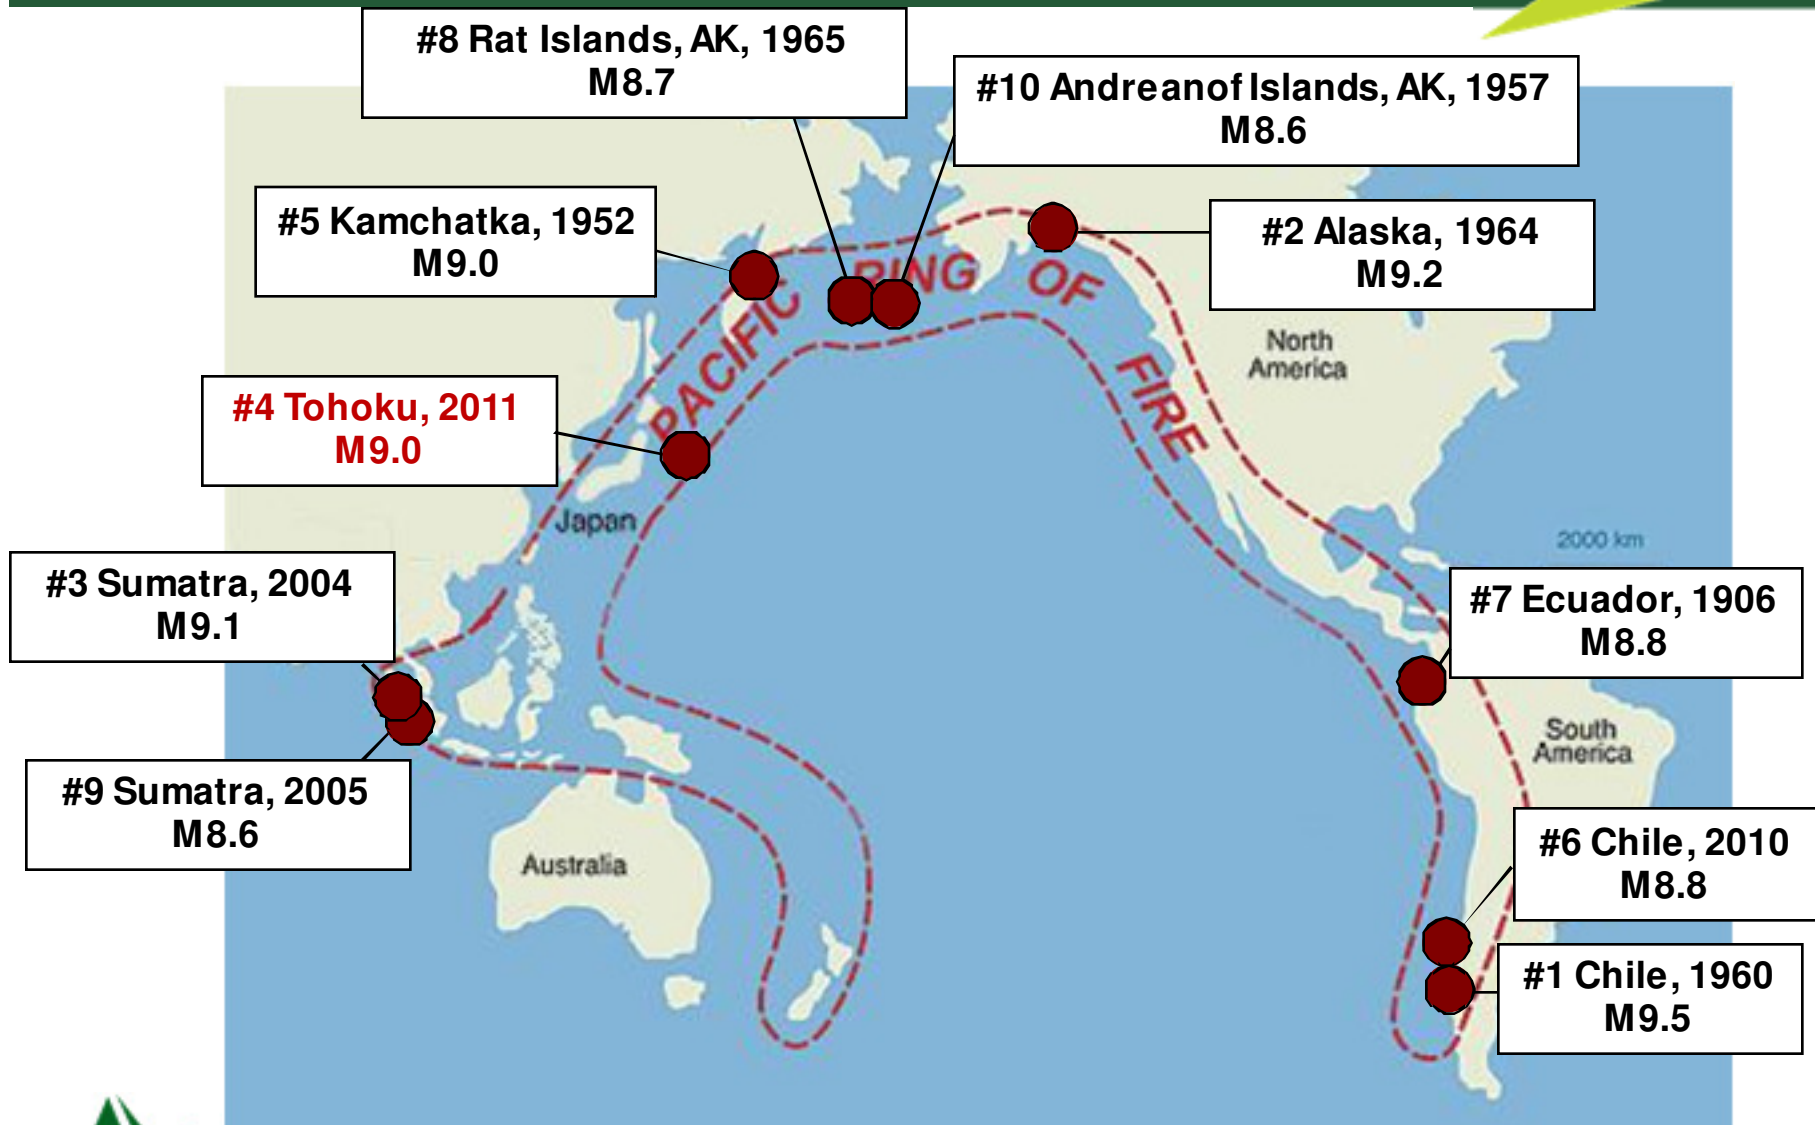

**September 2010 earthquake**  
\$2.7B - \$6.0B (NZD)

**February 2011 earthquake**  
\$5.0B - \$11.5B (NZD)

# The Pacific Ring of Fire Represents The Most Seismically Active Area in the World

# Japan Seismicity Is Dominated by the Subduction of the Pacific and Philippine Sea Plates

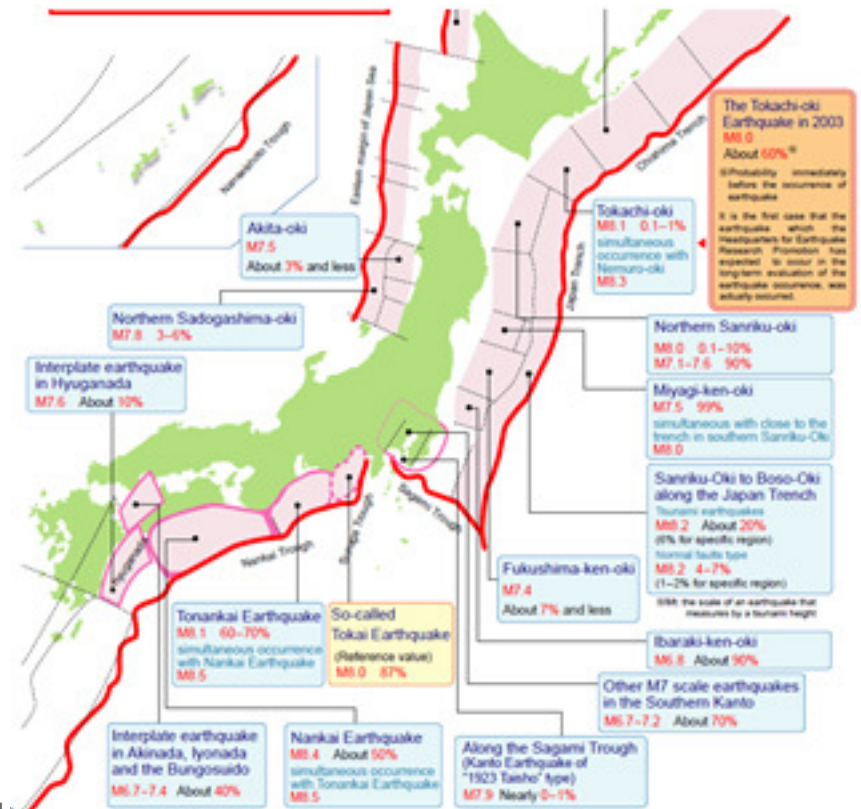

**Crustal Faults**

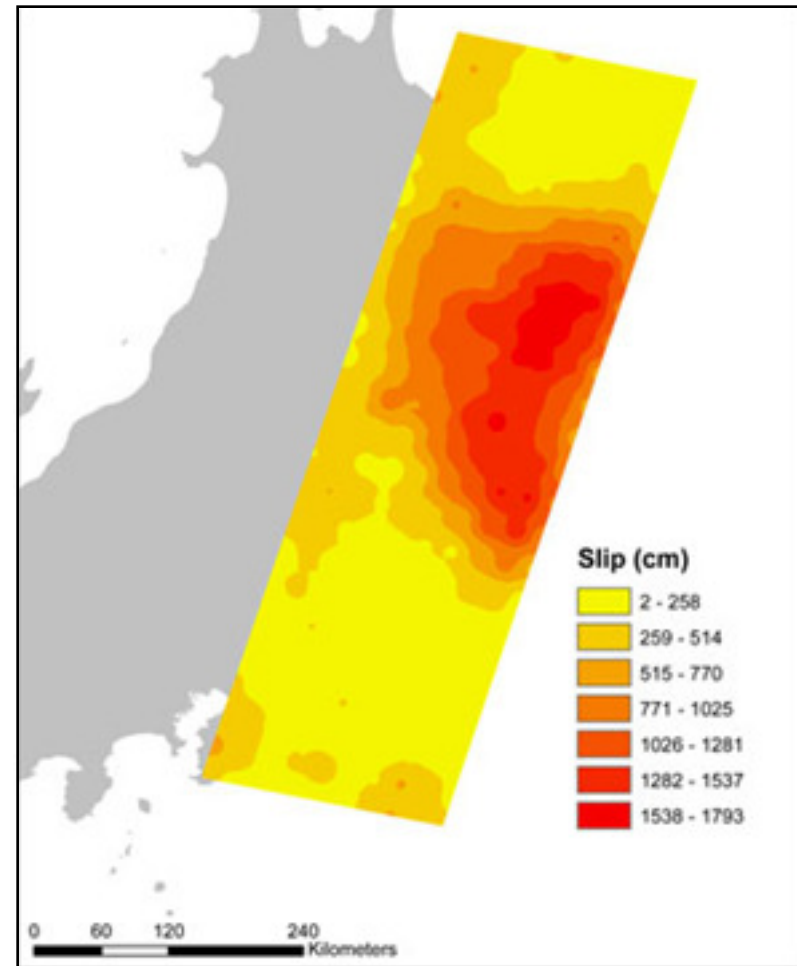

# HERP Hazard Work Did Not Include This Level of Seismicity in the Region

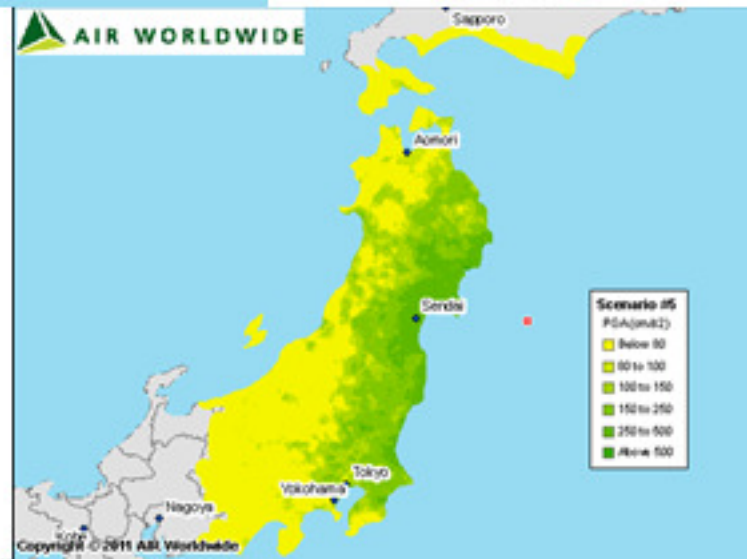

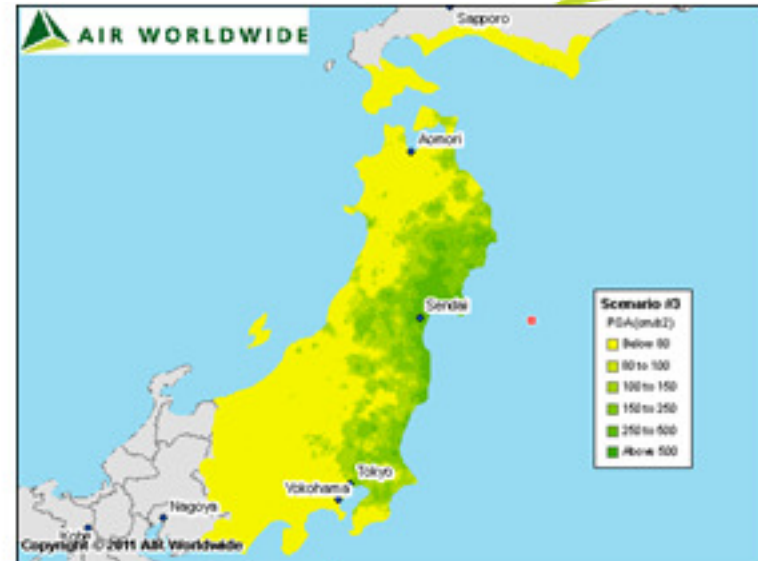

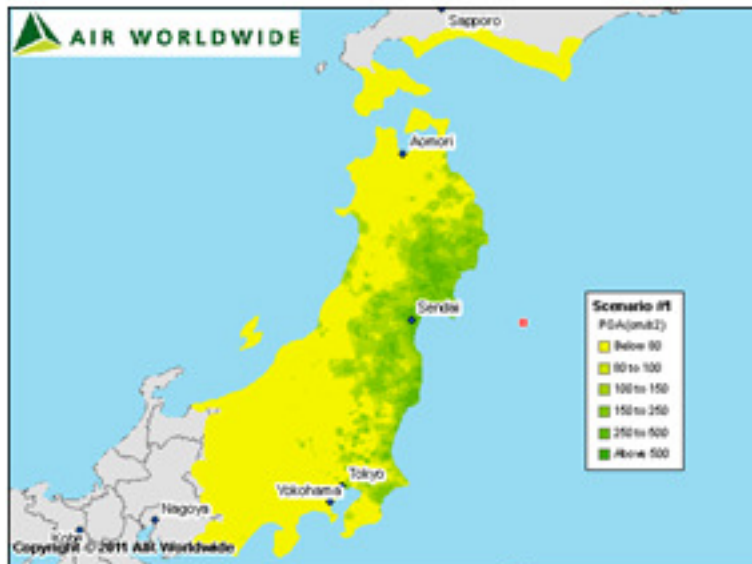

- HERP (Headquarters for Research Promotion) was established after the 1995 Kobe earthquake
- The 2005 regional seismicity model has gone through incremental updates in 2006 and 2007
- HERP report includes information on
  - 98 well studied faults
  - 178 other faults
  - about 26 subduction zone segments

# USGS-Estimated Fault Plane for 11 March 2011 Tohoku Earthquake

# Considerable Uncertainty Remains Surrounding the Intensity of this Earthquake

# AIR's Modelled Inland Tsunami Penetration in Natori and Sendai

# Knowing the Distribution of Exposure is Critical for Estimating Tsunami Loss Estimates

## Regions and Prefectures of Japan

Prefecture	0-1 km	1-2 km	2-3 km
Fukushima (7)	0.9	1.4	1.6
Ibaraki (8)	2.0	3.4	3.3
Iwate (3)	0.9	1.3	1.4
Miyagi (4)	1.3	3.4	4.0
<b>TOTAL</b>	<b>5.1</b>	<b>9.4</b>	<b>10.3</b>

Values in US\$ Billion

# ALERT Coverage and Loss Estimates for Tohoku Earthquake

**MAIN SHOCK – M9.0 Tohoku Region (Mar. 11, 2011)**

**EARLY OBSERVATIONS (March 11<sup>th</sup> and 12<sup>th</sup>)**

**15B to 35B USD INSURED LOSS\*  
(March 12)**

**K-NET  
Ground  
Motion Data  
Becomes  
Available  
(Mar 12-24)**

- \* The loss estimates do not reflect:
- Losses to uninsured properties
  - Losses to infrastructure
  - Indirect business interruption losses
  - Loss adjustment expenses
  - Losses from non-modeled perils, including tsunami and fire-following

**USING UPDATED GROUND  
MOTION DATA AND ACCOUNTING  
FOR TSUNAMI LOSSES**

**20B to 30B USD INSURED LOSS\*  
(March 24)**
