

THE RECENT TREND OF MORTALITY IN GREAT BRITAIN

BY C. D. DAYKIN, M.A., F.I.A., F.S.S., A.S.A.

ABSTRACT

This note continues a regular series on mortality rates in Great Britain, showing the mortality experienced in each age-group in 1990 and comparing this for broad age-groups, on a standardised basis, with mortality in earlier years.

KEYWORD

Mortality

THIS note continues a regular series on mortality rates in Great Britain; the previous note in the series appeared in *J.I.A. 118*, 501 and dealt with mortality in 1989.

Following the 1981 Census, estimates of the resident population have been produced on a new definition. This includes residents temporarily outside the country, but excludes foreign visitors. It includes members of both H.M. and foreign forces stationed in the United Kingdom, but excludes members of H.M. forces who are stationed abroad. The figures for deaths are not precisely consistent with the new definition of the population, since they do not necessarily include all deaths of residents temporarily absent from the U.K.

This note presents details of the mortality experience in 1990. The rates have been calculated using the deaths recorded as occurring in Great Britain each year and the resident population at 30 June of each year, as estimated by the Registrars General of England and Wales and of Scotland.

Table 1 shows central death rates for Great Britain for the year 1990, together with the ratios of these rates to the corresponding average rates for the 3 years 1980-82, which have been taken as a standard. Death rates in this form were published in *J.I.A. 112*, 75 for the years 1971 to 1983, in *J.I.A. 116*, 745 for the years 1984 to 1987, in *J.I.A. 117*, 151 for the year 1988 and in *J.I.A. 118*, 501 for the year 1989. To minimise the effect of changes in the age distribution of the population exposed-to-risk, the death rates for age-groups have been calculated, and the comparison with the 1980-82 mortality rates has been made, by standardising by individual ages on the age distribution of the Great Britain population at the 1981 Census.

The overall pattern of mortality changes over the last 50 years can be illustrated by reference to standardised group death rates for a few broad age-groups. These are set out in Table 2 for each year from 1971, as well as for 3-year periods about the Census dates in 1931, 1951, 1961, 1971 and 1981. The ratios of

*The Recent Trend of Mortality in Great Britain*Table 1. *Death rates for age-groups in Great Britain in the year 1990 and the ratios of those rates to the rates for 1980-82*

* Standardised on 1981 Census age distribution.

these rates to the 1980-82 standard are given in Table 3 and are also shown graphically in Figures 1 and 2. Six age-groups have been used: under age 1 (infants), 1-14 (children), 15-44 (younger adults), 45-64 (the middle-aged), 65-79 (the younger elderly) and 80 and over (the elderly). The group death rates and ratios have been standardised by single ages on the age distribution of the Great Britain population at the 1981 Census, so as to reduce the effect of changes in the age structure of the population.

Mortality overall (standardised by age-groups) was about 3% lower in 1990 than in 1989 for both males and females. It is now some 16% lower than in 1980-82 for males and 12½% lower for females. Mortality was higher than in 1989 in a number of age-groups. Male mortality showed increases for all 5-year age-groups between 15 and 39, whilst female mortality showed increases for the 10-14 age group, and no change at 25-29 and 35-39. Whilst mortality overall has fallen significantly as compared to 1980-82, it has risen somewhat for males in the age group 20 to 39, suggesting some evidence of increased mortality from AIDS. However, only part of this increase can be accounted for by reported deaths from AIDS in these age-groups.

The average level of mortality in the years 1988-90 was about 14% lower than the average in the years 1980-82 for males and 11% lower for females. Infant mortality fell by some 25% between these two periods and the mortality of children between 1 and 15 years of age fell by about 18%. Mortality failed to improve between 1980-82 and 1988-90 for males aged 20 to 34, for whom there were increases of between 1½% and 4½%. At ages over 60 the fall in mortality from 1980-82 to 1988-90 averaged some 15% for males and some 12% for females.
