Overview

- Longevity hedging via the capital markets is now possible
  - Pension plans can hedge longevity risk without buying annuities
- A new market for longevity risk is emerging
  - Investors are showing increasing interest in longevity-linked investments
  - Pension plans and insurance companies are actively evaluating hedging
- Obstacles to market development are being addressed
  - Standardisation
  - Education
- Messages for pension fiduciaries:
  - Longevity risk should be measured and this can be done quite easily
  - You don't have to transfer 100% of the longevity risk for hedging to be worthwhile
  - Index hedges can be highly effective: Basis risk can be managed

## Longevity risk reflects the uncertainty in future life expectancy

### ■ Increasing life expectancy is a challenge for pension plans

- E.g. each additional year of life expectancy adds 3-4% to the value of UK pension liabilities

### ■ Mortality improvements drive longevity risk

- Increasing life expectancy has been driven by falling, or "improving", mortality rates

Source: LifeMetrics Index (E&W = England & Wales)  
1. So-called "period" life expectancy assuming no further improvements in mortality

## Increasing longevity creates a larger financial liability for a defined benefit pension plan

### ■ The value of pension liabilities depends on expectations for the trend of future mortality improvements

- If the trend of mortality improvements is greater than expected this poses a huge risk

### Increase in liability value due to unexpected mortality improvement

## Longevity appears to be a good candidate to become a new market

### Because longevity exposure:

- Is transferable in principal
- Is economically significant: >£10 trillion globally
- Cannot be hedged in existing markets

### But market development also requires:

- Standardisation to create liquidity
  - Standardised Index
  - Standardised Instruments
- Education
  - Longevity is an unfamiliar risk
  - Perceived as more complex than it is

### The two sides of the market are hedgers (pension plans) and investors

- Investors are prepared to invest in longevity

A market for longevity risk is emerging

"LifeMetrics" is a toolkit developed to help pension plans measure and manage longevity risk

THE ROLE OF LONGEVITY INDICES AND MORTALITY DERIVATIVES

What is LifeMetrics?

- Launched by JPMorgan in March 2007 and freely available from the website
- [Longevity Index](#)
  - Longevity and mortality indices
  - England & Wales, US, Netherlands and Germany
- [Framework](#)
  - Methods and analytics for risk measurement & management
- [Software](#)
  - Tools for modelling and forecasting mortality

Features

- Transparent, non-proprietary, open-source and freely-available
- International
- Advisors: Watson Wyatt Worldwide and The Pensions Institute

Current and historic data available on website and Bloomberg

- [www.lifemetrics.com](http://www.lifemetrics.com)
- Designed to:
  - Increase visibility of longevity risk
  - Provide a standardised reference for longevity hedges
- Broken down by age, gender, country, metric
- Full documentation also available from the website
- Free, no login needed

## Framework for hedging pension longevity risk

- Hedging framework
  - Hedge the sensitivity in the value of liabilities to changes in mortality rates
  - Minimises the basis risk between longevity of members and longevity associated with hedge
- Longevity hedging is a natural extension to hedging other liability risks
  - Such as inflation and interest rate risk

There two broad categories of longevity risk hedges, both of which will transact

Customised Hedge:	Standardised Index Hedge:
<ul style="list-style-type: none"> <li>■ Tailored to reflect actual longevity experience of the pension/annuitants</li> <li>■ Structured as a cash flow hedge</li> <li>■ Maturity of Hedge:                             <ul style="list-style-type: none"> <li>■ When last member/annuitant dies</li> </ul> </li> <li>■ Indemnification paradigm</li> </ul>	<ul style="list-style-type: none"> <li>■ Standardised to reflect national population longevity experience                             <ul style="list-style-type: none"> <li>■ But calibrated to match mortality sensitivity of liabilities</li> </ul> </li> <li>■ Structured as a value hedge</li> <li>■ Maturity of Hedge:                             <ul style="list-style-type: none"> <li>■ Finite: E.g. 10 years or 20 years</li> </ul> </li> <li>■ Risk management paradigm</li> </ul>
=> Exact hedge	=> Cheaper, more liquid
Standardised has advantages of simplicity, cost & liquidity	

## Advantages and disadvantages of customised vs. standardised longevity hedges

	Advantages	Disadvantages
Standardised	<ul style="list-style-type: none"> <li>■ Cheaper than customised hedge</li> <li>■ Lower set up and operational costs</li> <li>■ More liquid, more easily unwound</li> <li>■ Shorter maturity (generally) so counterparty credit risk is limited</li> </ul>	<ul style="list-style-type: none"> <li>■ Not a perfectly exact hedge                             <ul style="list-style-type: none"> <li>■ Population basis risk</li> <li>■ Roll risk at maturity</li> </ul> </li> </ul>
Customised	<ul style="list-style-type: none"> <li>■ Exact hedge, no residual basis risk</li> </ul>	<ul style="list-style-type: none"> <li>■ More expensive than standardised</li> <li>■ Higher set up and operational costs:</li> <li>■ Poor liquidity, difficult to unwind                             <ul style="list-style-type: none"> <li>■ Difficult to adjust for changes in benefits</li> </ul> </li> <li>■ Longer maturity (generally) leading to larger counterparty credit</li> </ul>

Example: LifeMetrics longevity hedges can be built from a simple mortality derivative called a “q-forward”

- “Building-block” approach
  - Standardised hedging building-blocks called “q-Forwards”
  - Building-blocks are carefully combined to provide an effective hedge for a specific portfolio

“q-Forwards” pay out when mortality is lower than expected

- What are these building-blocks?
  - Simple capital market instruments
  - Based on LifeMetrics Index
  - Involve exchange of realised mortality rate in a future period for a fixed mortality rate
  - Hedges unexpected improvements in mortality

Sample term sheet for a q-Forwards

Term sheet for a single q-forward	
Notional Amount	GBP 50,000,000
Trade Date	31-Dec-07
Effective Date	31-Dec-07
Maturity Date	31-Dec-17
Reference year	2016
Fixed Rate	[1.2000%]
Fixed Amount Payer	JPMorgan
Fixed Amount	Notional Amount x Fixed Rate x 100
Reference Rate	LifeMetrics graduated initial mortality rate for 65-year-old males in the reference year for Germany national population. Bloomberg ticker: LMQMEW65 Index <GO>
Floating Amount Payer	ABC Pension Plan
Floating Amount	Notional Amount x Reference Rate x 100

### Hedging longevity over a 10-year horizon to 2018 Case study : A young DB pension plan

---

---

---

---

---

---

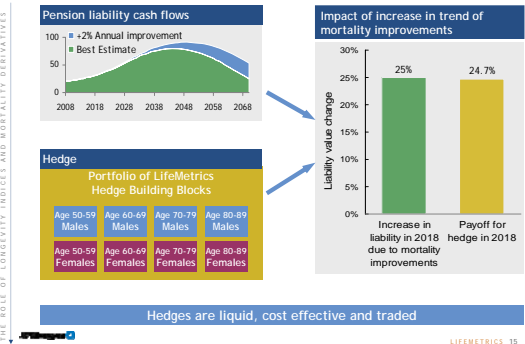

---

---

---

---

### Portfolio of building-blocks can provide an effective hedge of longevity risk for a pension plan

---

---

---

---

---

---

---

---

---

---

### Hedge effectiveness can also be measured stochastically

---

---

---

---

---

---

---

---

---

---

The basis risk associated with standardised hedges can be measured and managed

- Basis risk can be managed
  - Short term movements in mortality rates have a low correlations
  - But movements in the value of pensions for different populations are correlated over the long term

- Example
  - Annuity for cohort of males with the same demographics as CMI Male assured lives
  - Hedge based on LifeMetrics
  - Values track very closely over the long term

## Summary

- Longevity hedging via the capital markets is now a reality
  - Hedges are now available
- A new market for longevity risk is emerging
  - Key players will be pension plans and investors
- Obstacles to market development are being addressed by LifeMetrics
  - Standardisation
  - Education
- Key messages
  - Longevity risk should be measured and this can be done quite easily
  - You don't have to transfer 100% of the longevity risk for hedging to be worthwhile
  - Index hedges can be highly effective: Basis risk can be managed
