Measuring and Comparing Diversification

Dimitris Papachristou

30 October 2015

Agenda

- Preliminaries

1. Single Measures of Diversification

- Examples: Diversification Benefit, Diversification Score
- Pitfalls
- Can single measures be used? How can they be used?

2. Factors to consider when comparing Dependencies

3. Examples of alternative comparisons

Preliminaries

30 October 2015

3

Materiality of Correlations

$$\frac{\Delta C}{C} \approx \frac{C_i}{C} \cdot \frac{C_j}{C} \cdot \Delta \rho_{ij} = a_i \cdot a_j \cdot \Delta \rho_{ij}$$

- Assume: Lognormal loss distributions

	A	B	C	D
mean	100	40	200	150
st. dev	30	20	30	40

99.5th %ile	204	121	290	285
Ci=99.5th - mean	104	81	90	135
alpha	0.37	0.29	0.32	0.48

C=99.5th - mean	280	0.37=104/280	0.48=135/280
-----------------	-----	--------------	--------------

LoB	LoB	a _i *a _j
A	D	0.18
C	D	0.16
B	D	0.14
A	C	0.12
A	B	0.11
B	C	0.09

$$0.18 = 0.37 * 0.48$$

- If Cor(A, D) increases by 10% then
 - Approximate method above: capital will increase by ~1.8% (= 0.18 x 0.10)
 - Based on actual distributions and 100K sims capital increases by ~2% ± 0.5%

30 October 2015

4

Simple Measures of Dependencies

30 October 2015

5

Single Measures of Diversification

- A single measure summarising diversification is attractive
 - Management like it
 - Actuaries may like it
- Single measure usually have pitfalls
 - We need to be aware of them

**Single measures may still contain useful information,
but they may not be appropriate for direct comparisons**

30 October 2015

6

Diversification Benefit (D.B.)

30 October 2015

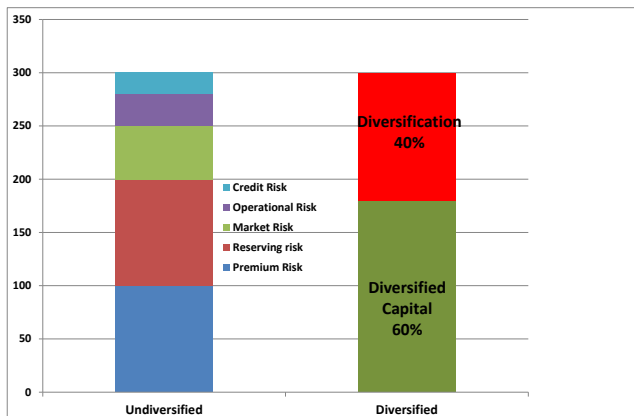

7

Diversification Benefit (D.B.)

Definition:

$(\text{Sum of Undiversified Capital} - \text{Diversified Capital}) / \text{Sum of Undiversified Capital}$

Premium Risk	100
Reserving Risk	100
Market Risk	50
Operational Risk	30
Credit Risk	20
Sum of Undiversified	300
Diversification Credit	120
Diversified Capital	180
Diversification Benefit	40%

30 October 2015

8

Diversification Benefit

Intuitive Measure, **but**

1. It only captures diversification at a certain level
2. It may be distorted by double counting of risks
3. It depends on the skewness of the marginal distributions
4. It depends on the number of risks and granularity
5. It may be distorted by expected profit
6. It depends on the relative size of risk charges

None of the above is related to dependencies!

30 October 2015

9

DB: Distortions by Granularity

When comparing Firms the same granularity should be used

Risk Type	Capital Risk Charge	Risk Type	Capital Risk Charge
Premium Risk	100	Premium Risk non cat	71
		Premium risk cat	71
Reserving Risk	100	Reserving Risk	71
		Reserving Risk PPOs	71
Market Risk	50	Market Risk	50
Operational Risk	30	Operational Risk	30
Credit Risk	20	Credit Risk	20
Sum of Undiversified	300	Sum of Undiversified	384
Diversification Credit	120	Diversification Credit	204
Diversified Capital	180	Diversified Capital	180
Diversification Benefit	40%	Diversification Benefit	53%

30 October 2015

10

DB: Distortion by expected profit

Suggestion: Expected Profit should be shown separately

- Similarly for other margins

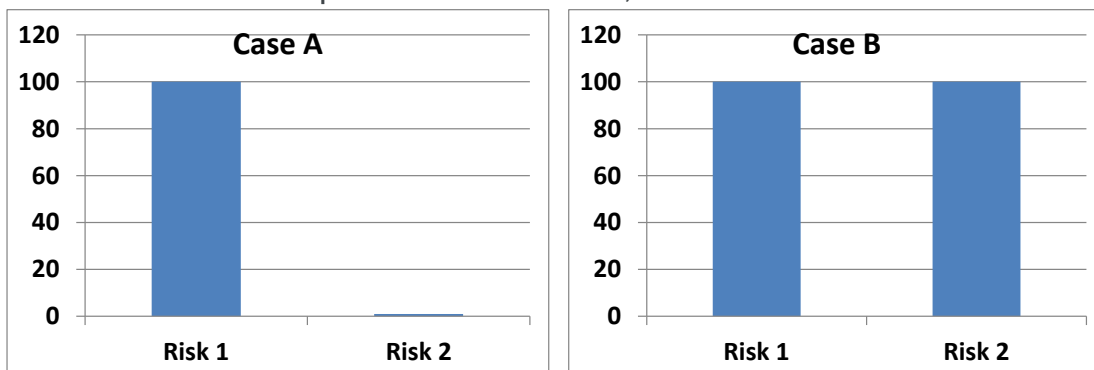

30 October 2015

11

DB: Distortions by Relative Size of Risk Charges

What is the maximum D.B. in each case?

- Case A: No scope for much diversification, insensitive to correlations
- Case B: More scope for diversification, sensitive to correlations

30 October 2015

12

Experiment with simulated risk charges

- Simulated randomly 5 capital risk charges for 1,000 Firms
- For each, calculated the s.d. of the risk charges (as %age)
- Low s.d. → similar sizes. High s.d. → dominant risk
- Assumed Normality when calculating Diversified Capital

St.Dev. of %age contribution		Risk 1 Risk 2 Risk 3 Risk 4 Risk 5					Sum of Charges	Div. Capital	DB
		Premium	Reserving	Market	Operational	Credit			
0.03	Firm 1	£ 81	£ 65	£ 97	£ 87	£ 76	£ 406	£ 183	55%
		20%	16%	24%	21%	19%	100%		
0.27	Firm 2	£ 63	£ 11	£ 1	£ 7	£ 10	£ 92	£ 65	29%
		68%	12%	1%	8%	11%	100%		

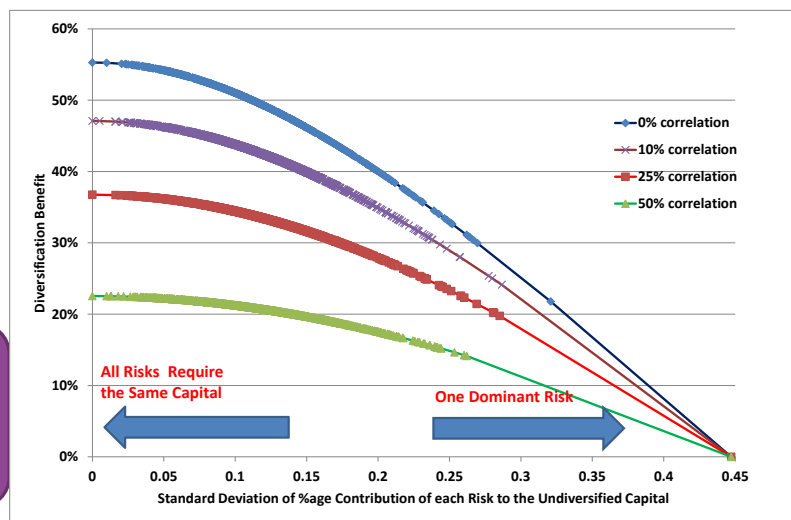

30 October 2015

13

How DB depends on Relative size of Risks and Cor.

- 5 Risks
- For a given correlation, D.B. is a function of the s.d. of risk charges
- Higher sensitivity of DB to correlations when s.d. is low

DB varies by correlation, but it can not be used as a measure of dependencies

30 October 2015

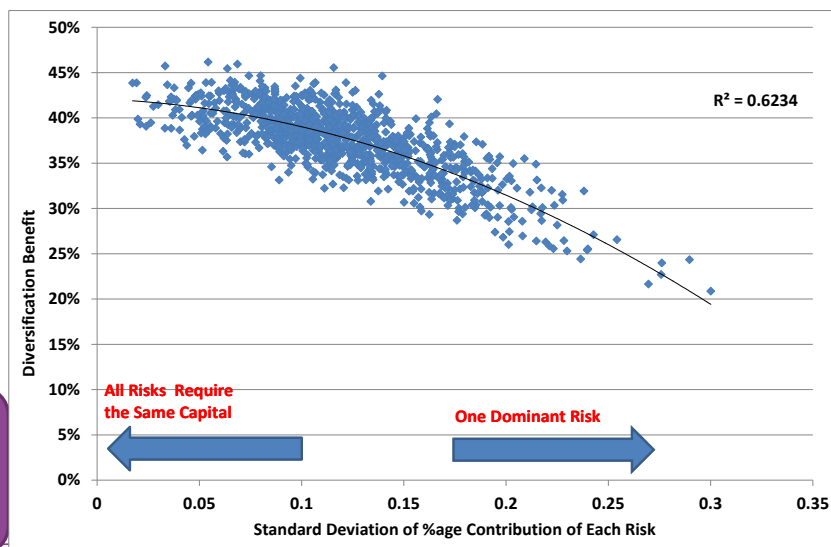

14

How DB depends on relative size of risks

- Random correlations between 0% and 35%
- The s.d. of the %age sizes (structure of risk charges) explains 60% of the differences
- **Similar observations for real data!**

Unadjusted D.B. is not appropriate for comparisons between firms

30 October 2015

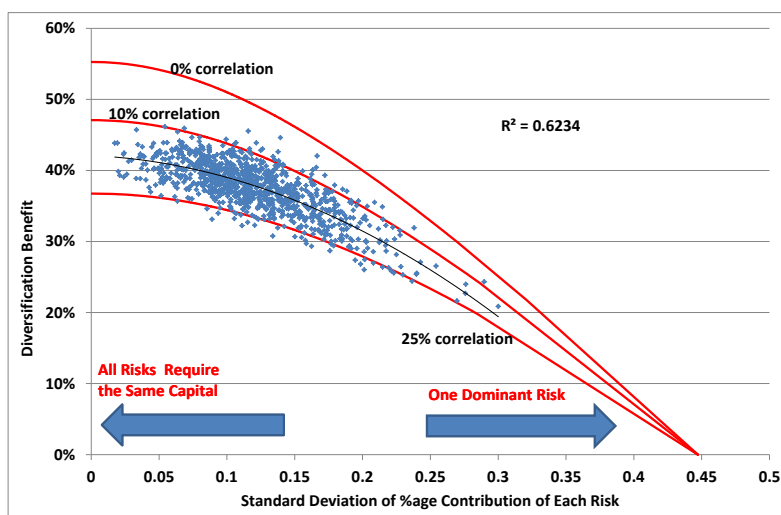

15

How DB depends on relative size of risks

- We could overlay the curves for different correlation levels

Assessment of diversification could be made either relative to the fitted line or the correlation curves

30 October 2015

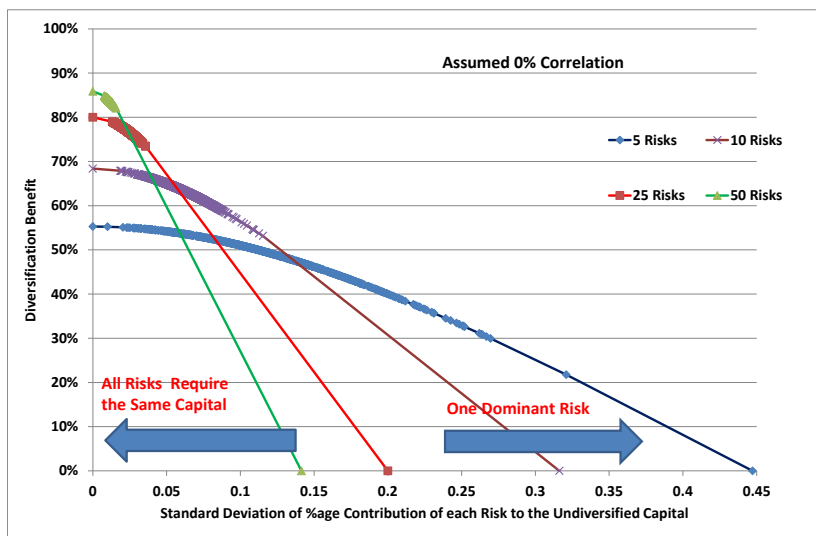

16

How DB depends on Relative size of Risks and # of risks

- The larger the number of risks the greater the scope for diversification
- DB becomes even less appropriate for comparisons between firms with different number of risks

When DB is used for comparisons the number of risks and their relative size should be taken into account

30 October 2015

17

Diversification Score (D.S.)

30 October 2015

18

Diversification Score (D.S.)

$$\frac{\text{Sum of Undiversified Capital Charges} - \text{Diversified Capital}}{\text{Sum of Undiversified Capital Charges} - \text{Capital assuming independent risks}}$$

Premium Risk	100
Reserving Risk	100
Market Risk	50
Operational Risk	30
Credit Risk	20
Sum of Undiversified	300
Diversification Credit	120
Diversified Capital	180
Capital for 0% Correl	150
Diversification Score	80%
Diversification Benefit	40%

$$\gg D.S. = \frac{300 - 180}{300 - 150} = 80\%$$

$$\gg D.B. = \frac{300 - 180}{300} = 40\%$$

DS: On the scale

0% fully dependent and

100% independent,

where does the diversified capital stand?

30 October 2015

19

Diversification Benefit

Diversification Score

30 October 2015

20

Diversification Score (DS)

Intuitive Measure, **but**

1. It only captures diversification at a certain level
2. It may be distorted by double counting of risks
3. It is distorted by highly skewed marginal distributions
4. It depends on the number of risks and granularity
5. It may be distorted by expected profit
6. It may be not be possible to calculate capital for 0% cor., but approximately

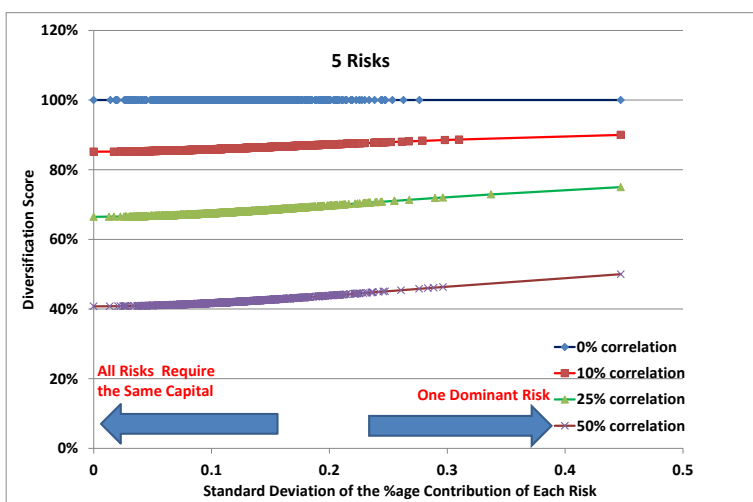

DS suffers from all the limitations of DB (plus one), BUT it depends less on the relative sizes of risks

30 October 2015

21

How D.S. Depends on Relative Size of Risks and Cor.

- Diversification Score depends on the relative size of risks, **but less than the D.B.**
- **This makes it more appropriate for comparisons than the D.B.**
- Unlike the D.B. the D.S. increases as few risks become more dominant.

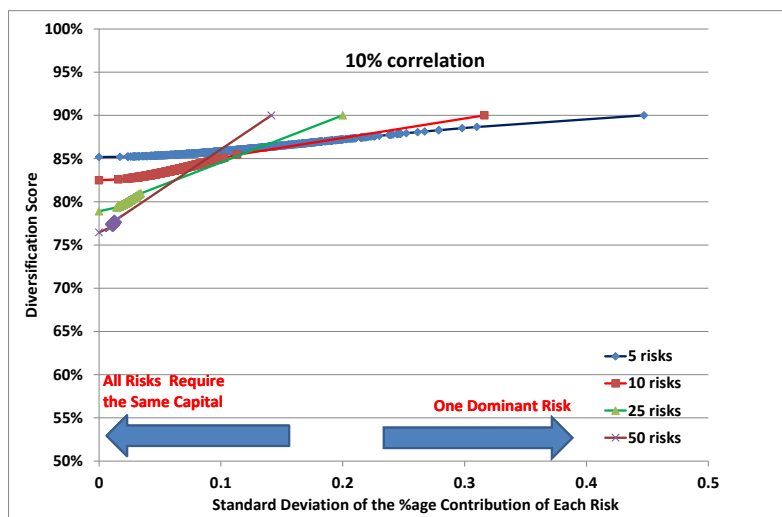

30 October 2015

22

How D.S. Depends on Relative Size and number of Risks

- 10% Cor. assumed
- Diversification Score depends on the number of risks. There is a lot of crossing of the lines
- **D.S. should not be used for comparisons of portfolios without taking into account differences in the number of risks**

30 October 2015

23

Other Ways of Looking at Dependencies

30 October 2015

24

Just Look at the Correlations and Conditional Tail Probabilities

- For a small number of risks this will be easy
- Always have next to the correlation table the materiality of the risk

Correlation Table						
Capital		100	100	50	30	20
		Risk 1	Risk 2	Risk 3	Risk 4	Risk 5
100	Risk 1	100%	20%	10%	10%	10%
100	Risk 2	20%	100%	10%	5%	5%
50	Risk 3	10%	10%	100%	5%	2%
30	Risk 4	10%	5%	5%	100%	5%
20	Risk 5	10%	5%	2%	5%	100%

Materiality Table						
		Risk 1	Risk 2	Risk 3	Risk 4	Risk 5
	Risk 1	0.308642	0.308642	0.154321	0.092593	0.061728
	Risk 2	0.308642	0.308642	0.154321	0.092593	0.061728
	Risk 3	0.154321	0.154321	0.07716	0.046296	0.030864
	Risk 4	0.092593	0.092593	0.046296	0.027778	0.018519
	Risk 5	0.061728	0.061728	0.030864	0.018519	0.012346

$$\frac{\Delta C}{C} \approx \frac{C_i}{C} \cdot \frac{C_j}{C} \cdot \Delta \rho_{ij} = a_i \cdot a_j \cdot \Delta \rho_{ij}$$

30 October 2015

25

Comparisons of Correlations

30 October 2015

26

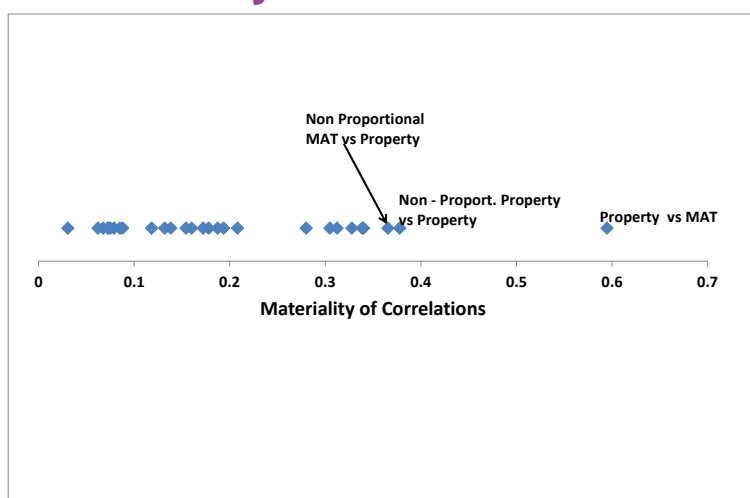

Comparisons of Correlations between Firms

- Comparisons should be made at the same level of granularity
 - Not a common level of granularity among Firms
 - SII classes too broad
- Even at the same level of granularity, different firms have different types of risk

30 October 2015

27

Materiality of Correlations

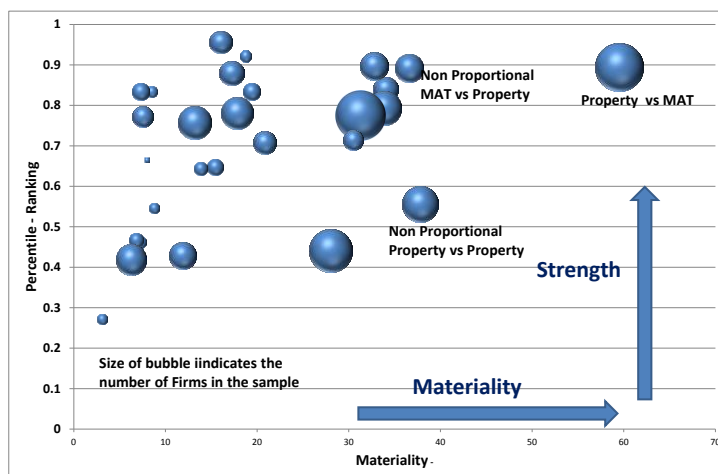

30 October 2015

28

Presentation of Comparison

- Add another dimension: ranking among a group of Firms
- The y – axis indicates ranking. It does NOT indicate correlation

30 October 2015

29

Limitations of the Comparison

- Correlations vary by Firm for many reasons
 - Differences in the portfolios' risk profiles
 - Size of the portfolio
 - others
- For each correlation the number of Firms in the sample introduces some bias
- The rankings do not provide information on the size of correlations between Firms
- It does not take into account tail dependencies
- Could a weighted average of the rankings, with materiality as the weight, serve as an index?

30 October 2015

30

Conclusions

- Single Measures of Dependencies, such as the diversification benefit, depend on factors unrelated to dependencies and should be used with care
- Dependencies should be examined at different levels of granularity and different aspects of them need to be considered before forming a view
- It will be useful for the profession to develop ways of summarising dependencies
